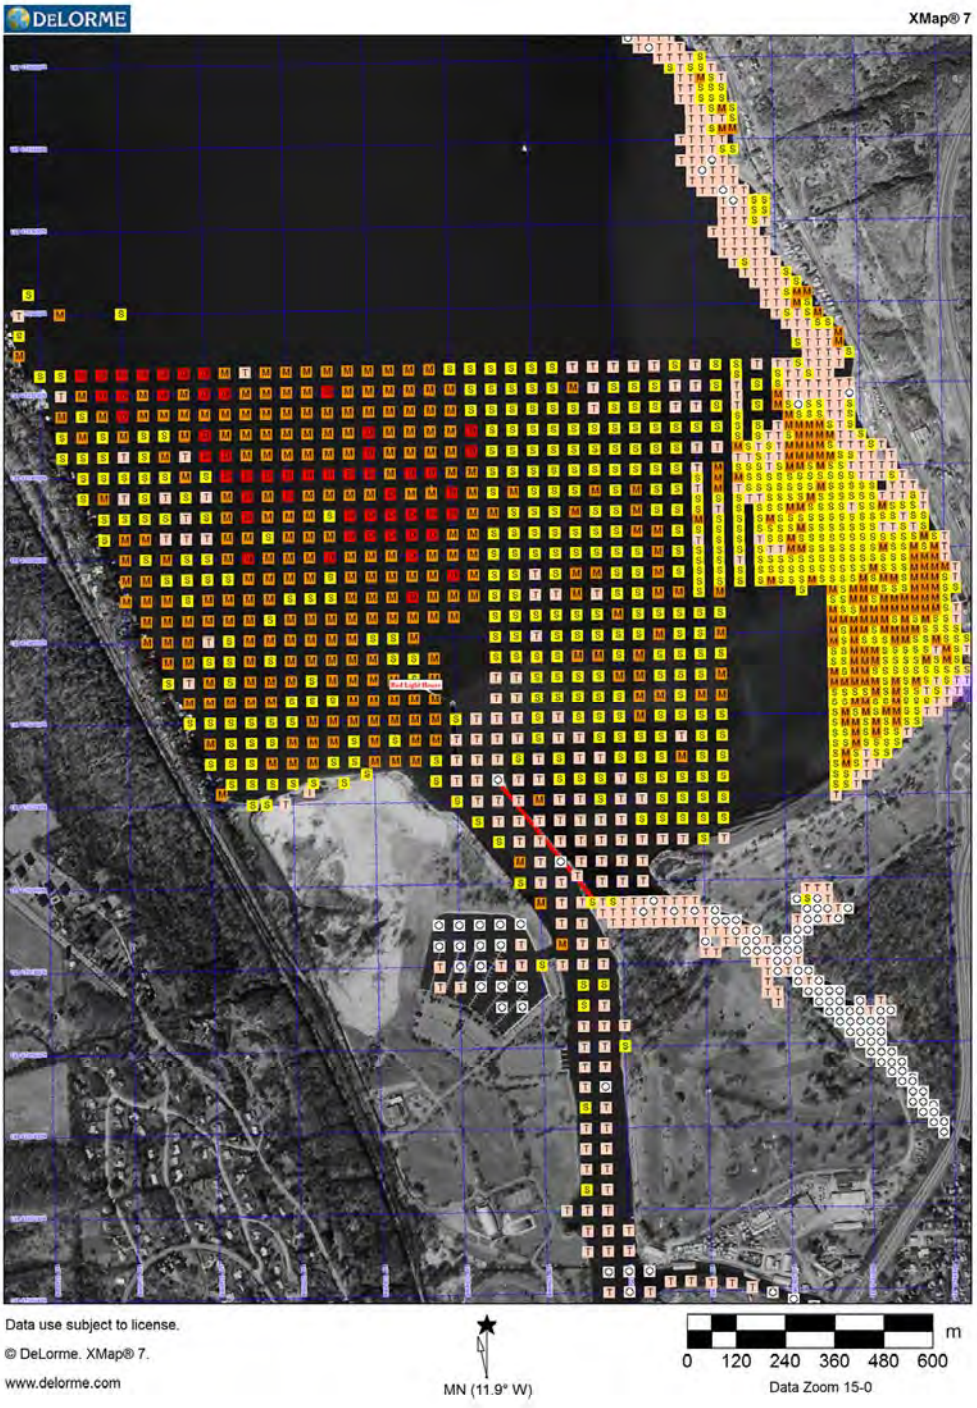
2017 Aquatic Plant Report of the Cayuga Inlet and Southern Cayuga Lake

Monoecious Hydrilla Eradication Project



Abundance - All Species Combined (Native + Non-native)

Ithaca Hydrilla Task Force Website

www.Stophydrilla.org

Cover Map and Monitoring Numbers

The cover shows the results of our rake-toss survey describing the abundance of All Plant Species Combined (Native + Non-native) at the southern end of Cayuga Lake, Cayuga Inlet and Fall Creek during 2017. Each individual colored square represents an evaluation of the total plant species abundance at a predetermined location identified by the interception of the X and Y lines of the Universal Transverse Mercator (UTM) coordinate system at North American Datum 1983 (NAD 83), true north.

This method assumes that the data values recorded from the collections of the two rake-tosses at the point of the line intercepts is representative of the aquatic plant species present with the abundance (an estimate of mass) of individual species at the time of sampling. Each colored icon is an estimate of mass within at least a 50m X 50m area, while in the southeast corner and lake shore we screened on a 25m X 25m area grid. This finer search pattern allowed us to better search the lake area that we felt had the greatest probability of new hydrilla finds.

The numbers of rake-tosses evaluated in 2017 within Cayuga Lake was 2902 compared to 4230 in 2016, 3416 in 2015, 2616 in 2014, 1886 in 2013 and 2128 in 2012. The numbers of rake-tosses made in 2017 to evaluate the ongoing Cayuga Inlet and Fall Creek herbicide treatments was 1826 compared to 1468 in 2016, 1462 in 2015, 1364 in 2014, 1184 in 2013 and 980 in 2012.

Rake-tosses				
	Cayuga Lake	Cayuga Inlet	Fall Creek	Total
2012	2,128	928	52	3108
2013	1,886	978	206	3070
2014	2,616	932	432	3980
2015	3,416	882	580	4878
2016	4,230	896	572	5698
2017	2,902	1,254	572	4310

Background and Executive Summary

We submit this 2017 annual report to Tompkins County Soil and Water Conservation District, Cayuga Inlet and Southern Cayuga Lake Hydrilla Task Force, New York State Department of Environmental Conservation, New York State Office of Parks, Recreation & Historic Preservation, United States Fish and Wildlife Service, The Nature Conservancy and Finger Lakes PRISM. Additionally, to Oswego County Soil and Water Conservation District, City of Ithaca, Tompkins County Health Department, Finger Lakes-Lake Ontario Watershed Protection Alliance, Tompkins County Water Resource Council, Tompkins County Environmental Management Council and all other interested parties. This document summarizes the 2017 aquatic plant evaluations from the plant monitoring surveys in the Cayuga Inlet, Fall Creek and the south end of Cayuga Lake, a report on the progress of eradication of the non-native invasive species, *Hydrilla verticillata*.

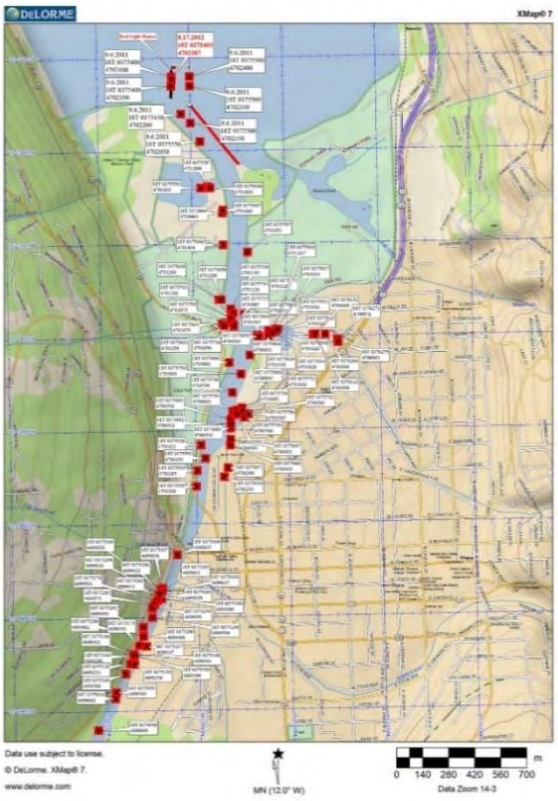
On August 5, 2011, the identification and expert verification of monoecious *Hydrilla verticillata* in the Cayuga Inlet at Ithaca, NY prompted a rapid response to stop the spread from the Cayuga Inlet of this non-native invasive to connecting waterways leading to the neighboring Finger Lakes and the Great Lakes. Local efforts began immediately to identify the location and extent of the hydrilla growth. Several volunteers sampled the Inlet and tributary waterways by recording the GPS (global positioning system) locations of hydrilla found by tethered double-headed garden rakes. We depict the initial 2011 – 2012 hydrilla findings in Figure 1 (findings are from the 2012 final project report and refer you to that report for details). Figure 1 further shows the progress in eradicating hydrilla growth from the Cayuga Inlet from 2013 through 2017 as measured by our rake-toss and visual plant survey methods. We did not find any hydrilla growing in the Cayuga Inlet in 2015 through 2017.

Hydrilla locations identified by this project from 2011 through 2017 are available on the website *i*MapInvasives. http://www.imapinvasives.org/new-yorklogin The New York State Environmental Protection Fund through the New York State Department of Environmental Conservation provides funding for the NY *i*MapInvasives Project as one of many partners supporting the website.

This report lists aquatic plant data collected by surveys in 2017 using the line intercept method (Madsen 1999) in Cayuga Inlet, Fall Creek and Cayuga Lake by Racine-Johnson Aquatic Ecologists of Ithaca, NY. We determined the presence and location of plant species by this line intercept method and additionally added an estimate of each species' abundance (estimated biomass) from each rake-toss. We depict this 2017 information in tables, graphs, abundance maps and pie charts to provide the status of the aquatic plant community. The Management Plan for this project requires that we document the progress of hydrilla eradication from known locations and the various management techniques used. Equally important is the monitoring effort to document depletion of the non-germinated hydrilla tubers still possibly viable in the sediments. These propagules are the product of previously matured hydrilla vegetative growth. The information collected about aquatic plant biology, the effectiveness of the various control methods and specific herbicide efficacy drive the Local Hydrilla Task Force's ongoing management decisions.

The New York State and Local Hydrilla Task Force's plan of eradication for this infestation requires depletion of the population of subterranean hydrilla turions (tubers) to zero. This occurs primarily by tuber germination and then prevention of vegetative growth that could produce new turions. Prevention of the initiation of any new turions (tubers or axially turions) is paramount and accomplished by eliminating all new vegetative growth each season before turion formation can take place. We illustrate in this report through graphs and figures tuber depletion, elimination of above sediment growth and further show a dramatic decrease in hydrilla presence. The report details overall aquatic plant community composition and changes within the project area.

This report shows continuing progress toward the goal of eliminating hydrilla from the tributaries flowing into, and the southern end of, Cayuga Lake. Despite this progress, the major challenges of locating hydrilla growing in the lake remain. The absence of hydrilla at all sampled locations in the Cayuga Inlet and Fall Creek where tuber densities decreased to zero in 2015 and 2016 respectively is encouraging.



Fall 2011 and 2012

2013

2014

2015 to 2017

Figure 1. Locations in the Cayuga Inlet where rake-toss surveys identified *Hydrilla verticillata* in: 2011 and 2012 (top left), where we found hydrilla in 2013 (top right), in 2014 (bottom left) and in 2015 to 2017 (bottom right). In 2014, our rake-toss sampling found hydrilla only in the Cornell University Boathouse Bay within the Inlet. In 2015 to 2017, our extensive searches did not find hydrilla anywhere in the Cayuga Inlet after extensive rake-toss sampling and visual monitoring.

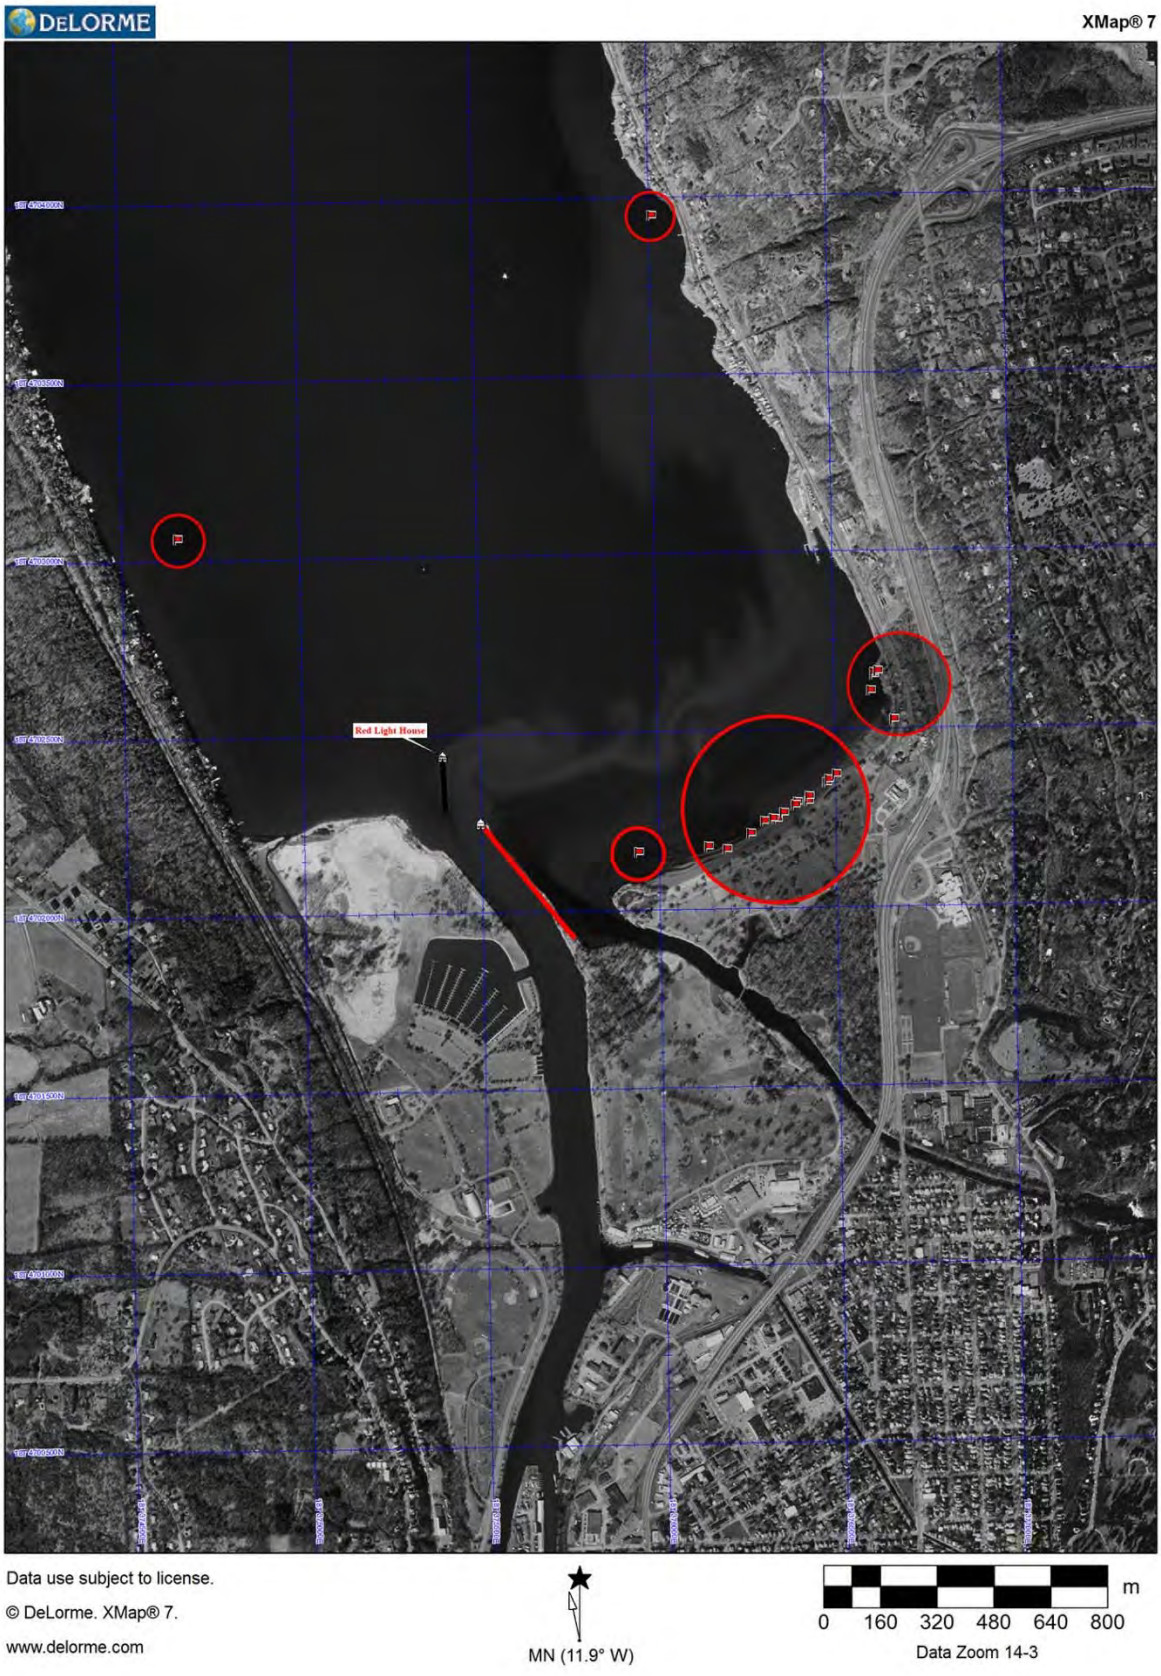


Figure 2. 2017 locations where we found hydrilla by rake-toss and visual searches. In the Cayuga Inlet and Fall Creek, we recorded 0 locations with growing hydrilla. In Cayuga Lake, we recorded 23 distinct locations with growing hydrilla. There were two outlier hydrilla finds, one in the southwest corner and the other to the north of the Merrill Sailing Center. We have listed the GPS of the locations in Coordinates 1, within the Appendix of this report and entered the data into *i*MapInvasives.org. http://www.imapinvasives.org/new-yorklogin

Figure 3. 2016 locations where we found hydrilla by rake-toss and visual searches. In the Golf Course Lagoon in Fall Creek, we recorded 6 distinct locations with growing hydrilla. In the Cayuga Inlet and Cayuga Lake, we recorded 0 locations with the presence of hydrilla. We have listed the GPS of the locations in Coordinates 1, within the Appendix of this report and entered the data into *i*MapInvasives.org. http://www.imapinvasives.org/new-yorklogin

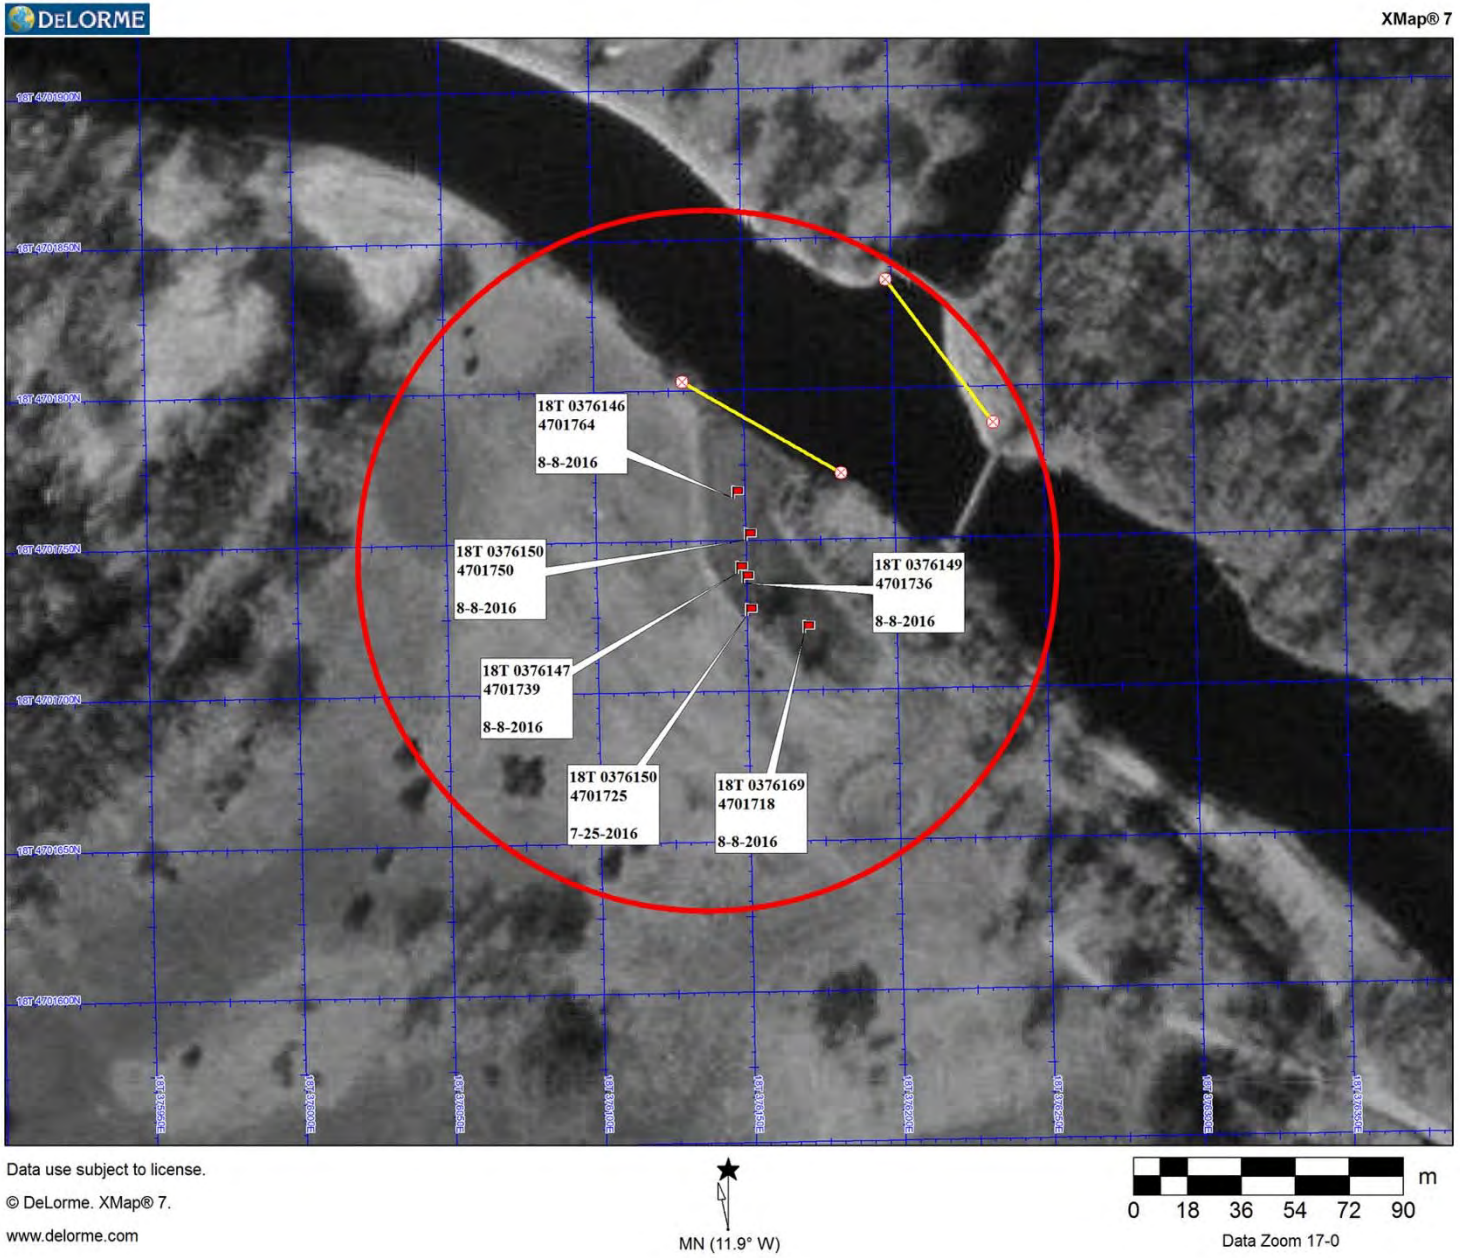

Figure 4. 2016 locations, identified by GPS and date, found in the Golf Course Lagoon in Fall Creek. GPS locations above are the only 2016 hydrilla vegetative growth found within the entire survey area.

Figure 5. 2015 locations where we found hydrilla by rake-toss and visual searches. In Fall Creek we recorded 63 distinct locations with growing hydrilla and in Cayuga Lake we recorded 8 locations with the presence of hydrilla.

Figure 6. 2014 locations where we found hydrilla by rake-toss and observation. In 2015 and 2016, we did not find any hydrilla growing at the Cornell University Boathouse Bay. In the SE corner of the lake the four locations with hydrilla inside the circle, to the left, did not reappear in 2015. In 2016, we did not find any hydrilla in the SE corner of the lake.

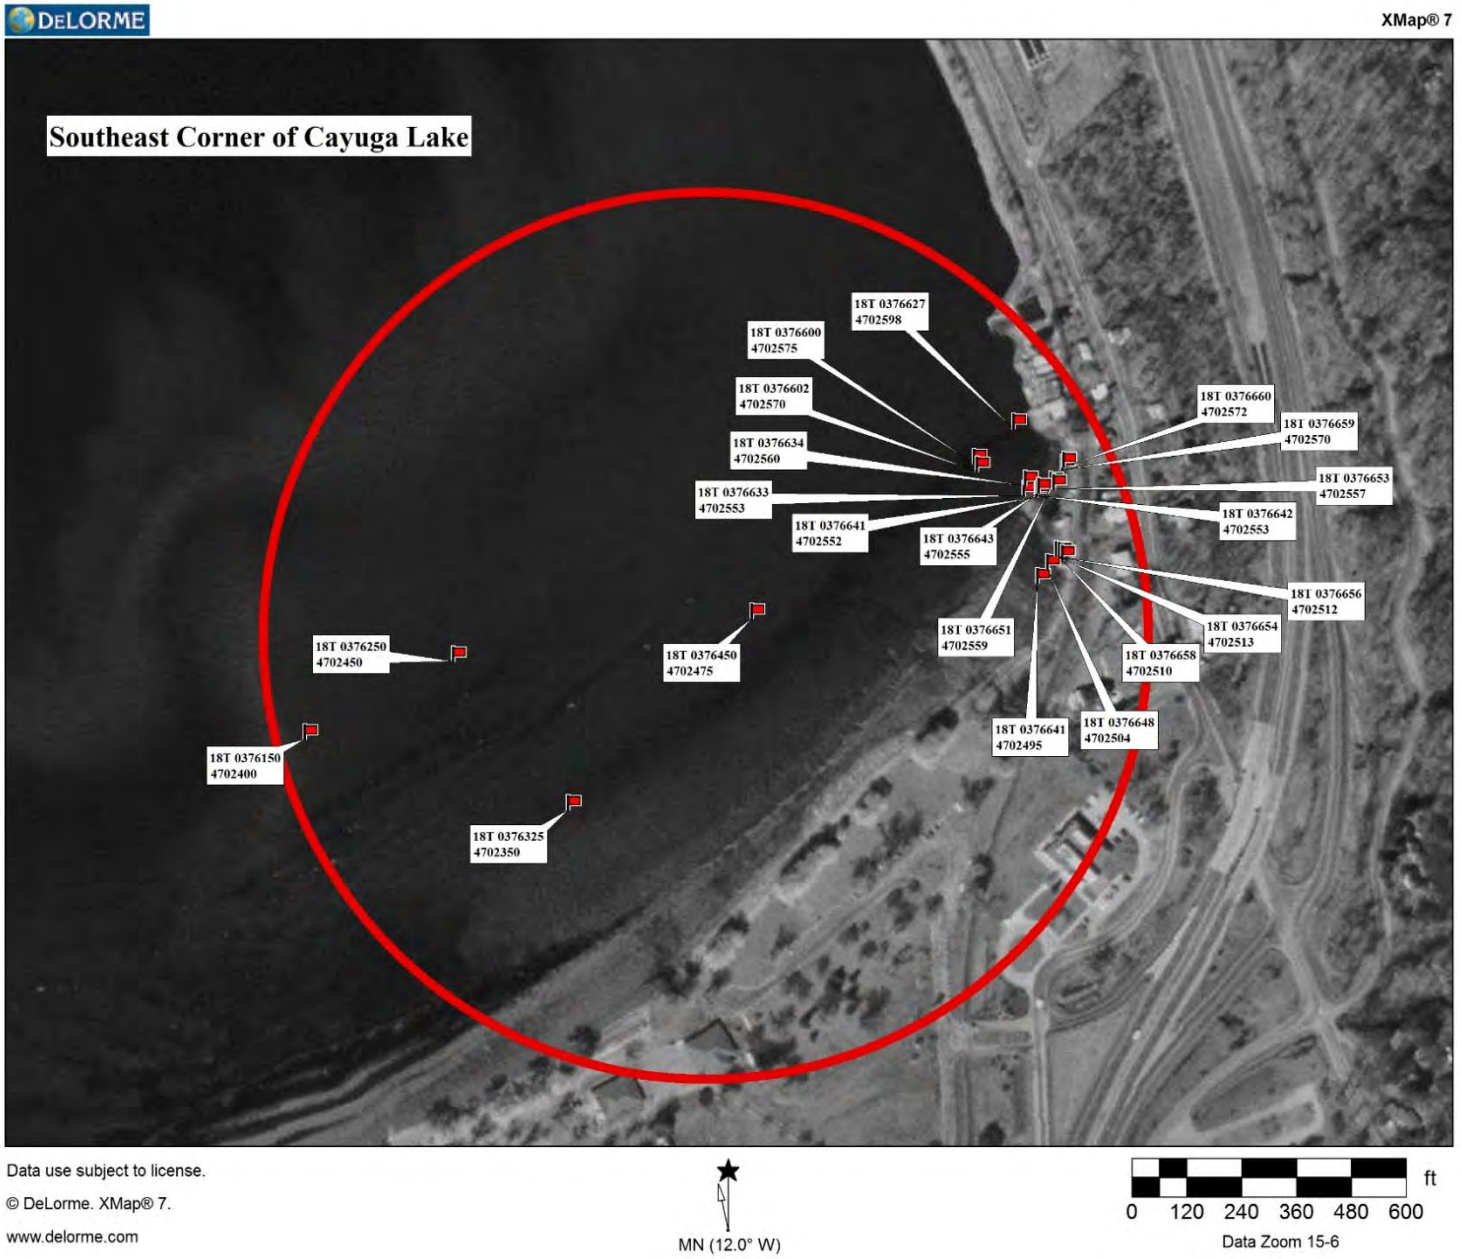

Figure 7. 2014 GPS locations where we found hydrilla by rake-toss and observation at the SE corner of Cayuga Lake. The four hydrilla finds in the extreme left within the circle in front of Stewart Park were fragments that did not materialize as rooted plants in 2015. The majority of the hydrilla finds in the SE corner were rooted patches and we covered those patches with benthic barriers in the early fall of 2014. We found no evidence of hydrilla at the benthic barrier sites in 2015 or 2016.

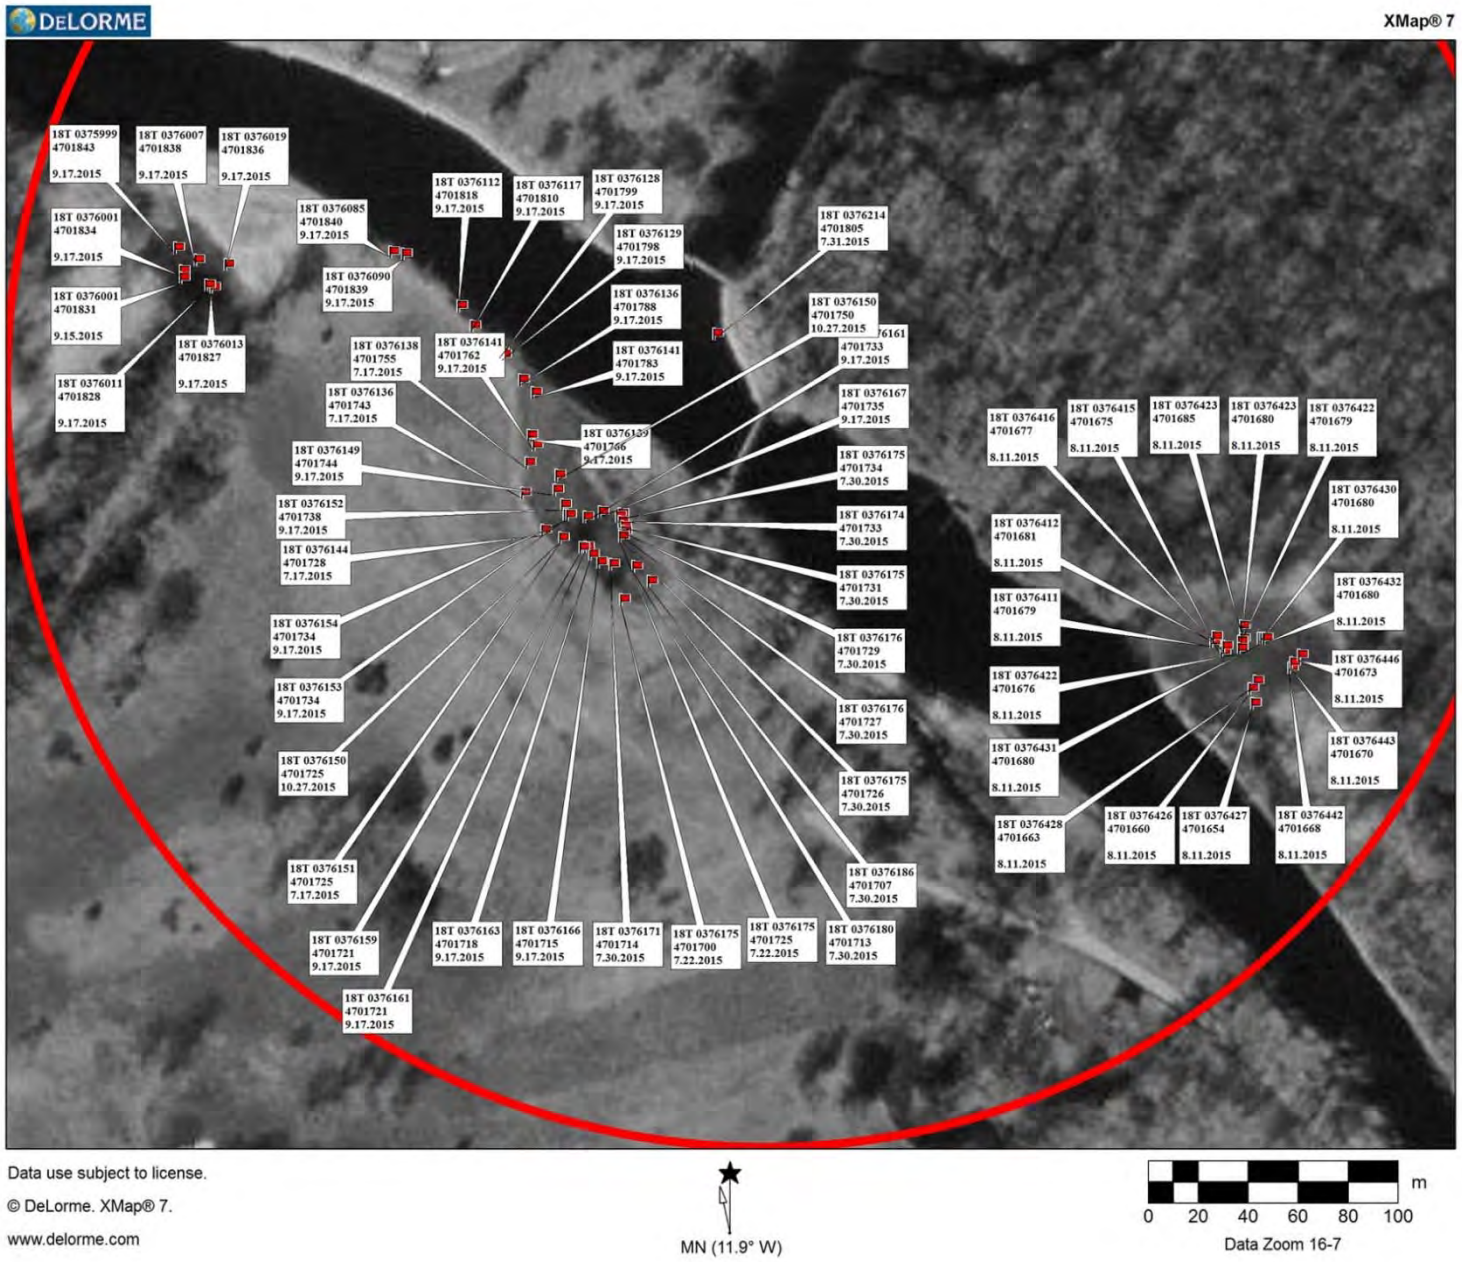

Figure 8. Locations identified in 2015 by GPS in Fall Creek, where we found hydrilla by rake-toss and observation. GPS locations above include all 2015 growing hydrilla, found before or after herbicide treatments. In 2016, we only found hydrilla in the Golf Course Lagoon area of Fall Creek where we identified tubers produced in 2015.

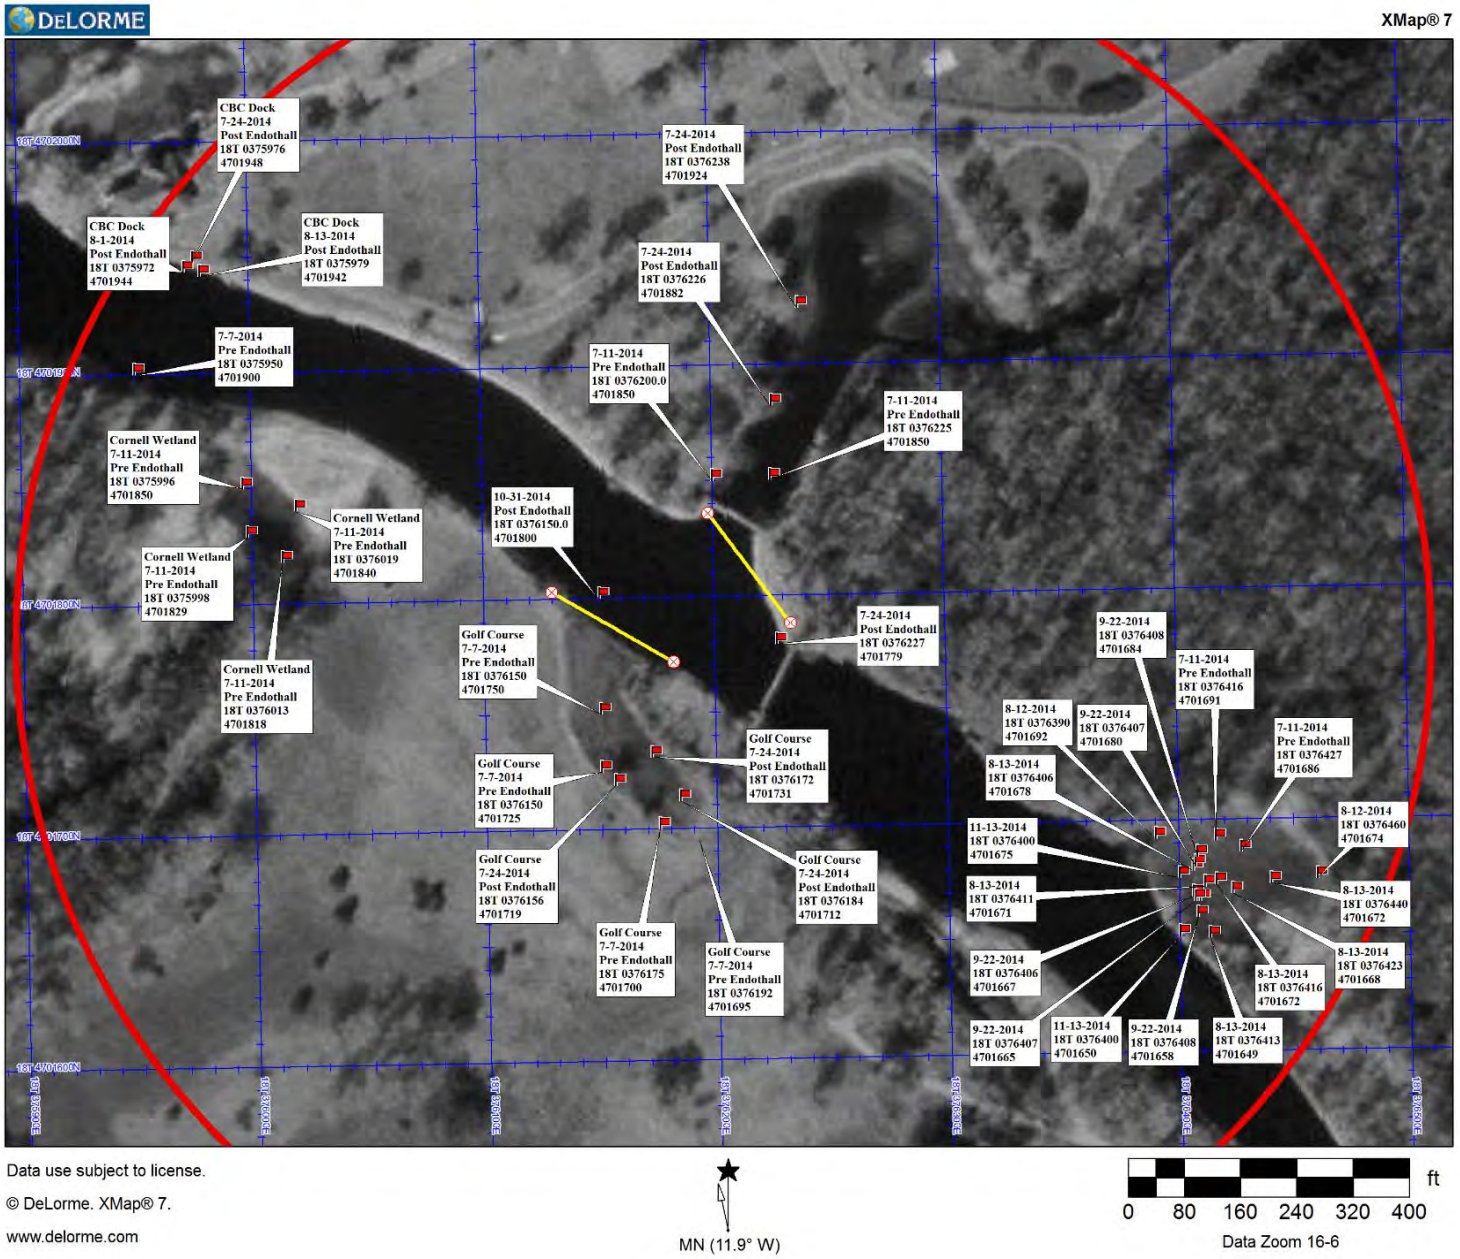

Figure 9. 2014 Fall Creek GPS locations where we found hydrilla within Fall Creek (pre- and post-herbicide application surveys). Locations identified above have hydrilla tubers in the sediment that need future treatments. The two yellow bars in the center are barrier curtains that aid hydrilla eradication efforts by limiting access to the Stewart Park Pond and the Golf Course Lagoon while possibly slowing the rate of dilution of herbicide treatments by limiting water flow in both areas.

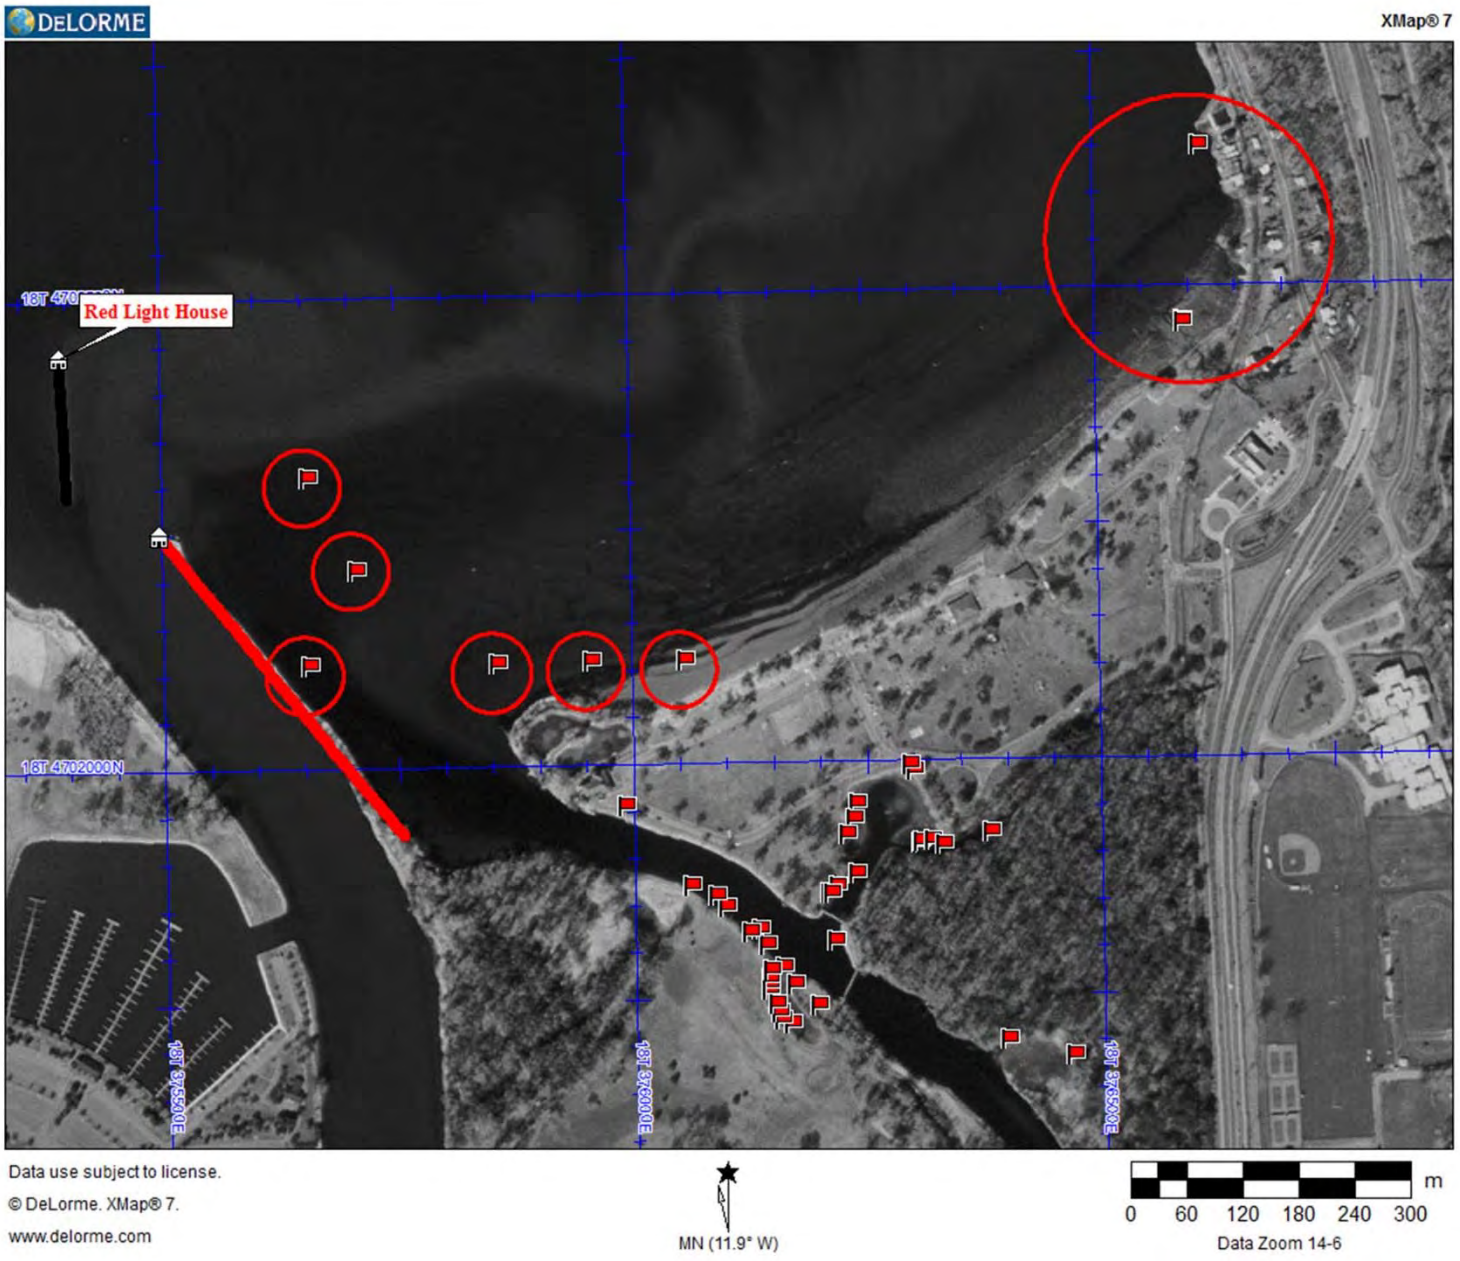

Figure 10. 2013 Cayuga Lake locations of hydrilla found by rake-toss. The two large rooted patches shown above in Cayuga Lake's SE corner discovered August 21, 2013. We successfully treated by hand removal and benthic barrier placement before Labor Day weekend of 2013. Hydrilla did not recur at those two locations from 2014 - 2017.

In 2017, the Ithaca Hydrilla Task Force's herbicide treatment began at Fall Creek on August 9, 2017 with the herbicide Sonar Genesis (fluridone liquid) applied as continuous drip into Fall Creek, for 56 days, until October 4, 2017 (79.3-gals total) from one injection point. Applications of Sonar H4C (fluridone pellet) occurred on 8/10, 8/31 and 9/14/2017 (130.56 lbs. total) in the backwaters of Fall Creek.

In 2017, no herbicide treatment occurred in the Cayuga Inlet. With the absence of hydrilla in the Cayuga Inlet in 2015, there was no Aquathol-K (endothall) application in the Inlet or Sonar H4C (fluridone pellet) application to the NYS Allan H. Treman Marina in 2016. A Sonar Genesis drip application for 70 days into the Cayuga Inlet started on July 22, 2016 and terminated on September 30, was the only herbicide application to the Inlet in 2016. In 2015 - 2017, our survey crews did not find any hydrilla in the Inlet after extensive rake-toss sampling, visual monitoring and tuber sampling.

The Cayuga Inlet's monoecious biotype of hydrilla seems to germinate and emerge in late spring and often delays growth and elongation toward the surface until late July/early August. The plant continues to increase mass and produce turions (tubers) into the late fall. We document hydrilla spring emergence and subsequent growth by monitoring both tuber germination and vegetative emergence to determine the best timing for treatment options and aid early detection of new hydrilla growth. In Cayuga Lake and upstate New York, data and experience suggest the most probable time to find new areas of growth with rake-toss surveys, scuba and shallow water observations is after August 15 into the late fall.

Figure 11. The pictorial above shows the total area searched in 2017 and the estimated density for All Species Combined at each rake-toss location. The hydrilla on the right was the late season hydrilla found in 2015 at 3.5 meters deep off the southeast shoreline just north of all previous hydrilla finds in the lake. The two 2017 hydrilla finds at deep depths were of a similar growth stage.

Timing of rake-toss plant monitoring depends on the type and purpose of the surveys with our following dates of rake-toss surveys in 2017. The Fall Creek tributary pre-herbicide monitoring began and finished on June 29. Aquatic plant monitoring in the Cayuga Inlet and Lighthouse early summer monitoring began on June 28 and finished on June 29, 2016. Plant monitoring in Southern Cayuga Lake began on July 18, 2017 and we finished on November 29, 2017. In 2017 we discontinued searching the backwater ditch south from Six Mile Creek running past the big box stores on Route 13, an area the Local Task Force withdrew from future herbicide treatments in 2014 and we last surveyed on November 19, 2016. Cayuga Inlet and Lighthouse early fall monitoring started on October 10, 2017 and finished on October 18, 2017. Fall Creek tributary post-herbicide monitoring began on

October 18, 2017 and finished on October 19, 2017. In all regular monitoring efforts, we recorded all plant species within the submersed plant communities and identified any new hydrilla locations. In 2017, we conducted a third rake toss survey of "hydrilla only" monitoring of the Cayuga Inlet and we did not find any hydrilla.

Figure 12. 2015 photo of hydrilla with fully developed tubers in late summer at the herbicide treated Golf Course Lagoon suggesting future growth from those tubers will occur in 2016, as it did. The only area where we found hydrilla in 2016.

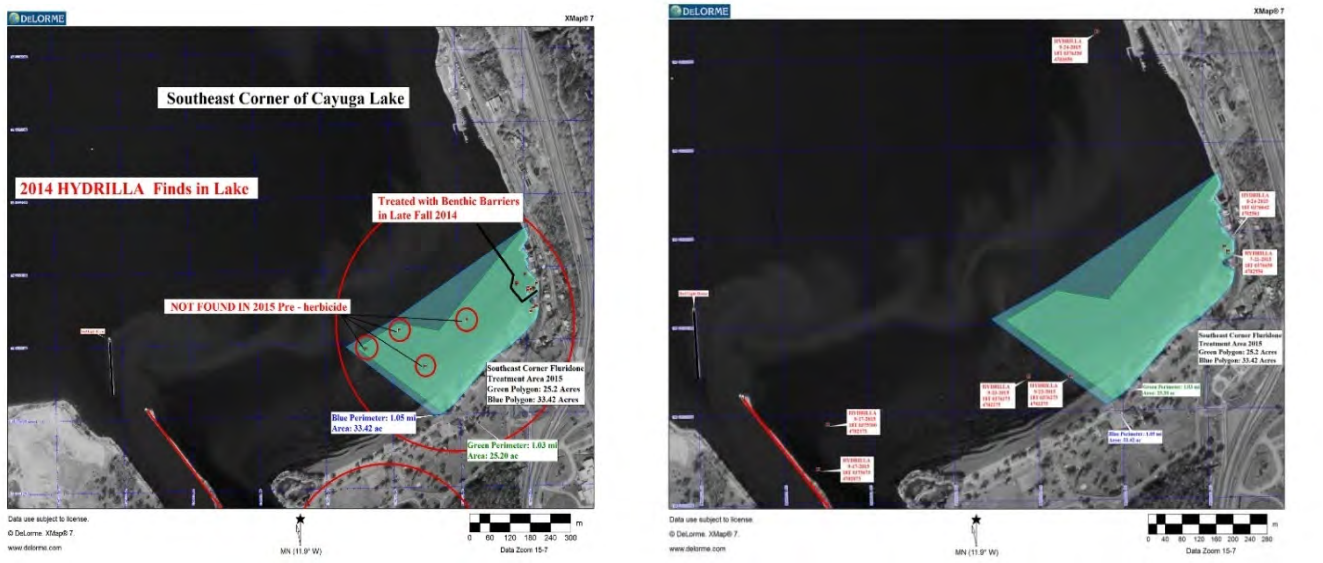

Figure 13. 2015 herbicide treatment area in Cayuga Lake shown as the teal green area above. Hydrilla locations in 2014 (left map) determined the area of treatment with the herbicide fluridone as Sonar H4C, a pellet formulation. Four applications of fluridone pellets applied on July 21, August 11, September 16 and October 1, 2015 constituted the chemical treatment. Prior to 2015, and after the 2015 herbicide treatment in the SE corner we treated hydrilla growth with benthic barriers through 2017. The 2014 hydrilla finds at the left side in the treatment zone did not appear in 2015 (right) preventing an adequate assessment of efficacy of the Sonar H4C applications.

The discovery of hydrilla growing in the southeast corner of Cayuga Lake on August 21, 2013 (Figure 14) prompted discussion within the Local Hydrilla Task Force as to a course of action. With the upcoming Labor Day holiday and the potential for increased traffic on the lake in the area where we found the robust growth, the Task Force recommendation was to remove the growth by hand. During the last week in August, we set up 2 mesh barriers around the hydrilla beds and hand-removed vegetative growth along with as much root and tuber growth from the sediment as possible. After plant removal and before removing the surrounding mesh barrier, we placed several benthic barriers on the area of the lake bottom that was hand harvested. The extent of growth and its tuber development suggested all vegetative growth found in late August 2013 likely arose from a single propagule at each of the two locations. From 2014 through 2016, we observed no hydrilla growth on or near these areas that we treated with hand harvesting and benthic barriers in 2013. In 2017, we found additional growth of hydrilla near the original benthic barriers, along Stewart Park and to the right of the mouth of Fall Creek (Figure 2).

Figure 14. Hydrilla growth in the SE corner of Cayuga Lake found August 21, 2013 and removed by August 30, 2013, we did not find hydrilla at these remediated locations from 2014 through 2017.

We made a change in our rake-toss sampling strategy during 2014 by using a 25m X 25m UTM search grid in place of the 50m X 50m grid to sample plant presence at Cayuga Lake's south end from the east shore at Stewart Park and to the Hog's Hole on the west shore. Because of the hydrilla finds in the lake during 2013, we increased sampling locations greatly in this southern end area in 2014.

In 2014, we found in the SE corner of Cayuga Lake new hydrilla growth starting on July 9, 2014 with the last hydrilla found on October 31, 2014. We did not remove the hydrilla plants as we did in 2013 before placing the benthic barriers on top of the rooted growing hydrilla. Additionally, in 2014, the local task force conducted a two-day hand removal of hydrilla vegetative mass from the Fall Creek Cove, a location where herbicide treatments were ineffective at removing hydrilla. We hand removed hydrilla from some areas of the Golf Course Lagoon at Fall Creek in 2015 where growth persisted in late summer/early fall despite herbicide treatments. In 2016 at the Lagoon, application of herbicides Aquathol-K and Sonar H4C occurred on August 9, with additional bump applications of Sonar H4C later.

Hydrilla found within Cayuga Lake in 2014 was at a distance from the two beds of hydrilla found in 2013 and we believe these 2014 plants started from other fragments that came into the lake later than the growth found in 2013. It is possible this 2014 Cayuga Lake hydrilla came from the Fall Creek area, likely during the major August 8, 2013 rain storm. We continued to find fragments in the SE corner in 2015 along with finds at the mouth of Fall Creek, which we believe, float into the lake from the Fall Creek infestation each year. In 2016, we found no hydrilla fragments in Cayuga Lake. In 2016, the only hydrilla found were rooted fragments at the Golf Course Lagoon in Fall Creek (Figures 3, 4). In 2017, 23 locations had hydrilla found by rake-toss or visually in the southern end of Cayuga Lake (Figure 2, Coordinates 1).

Due to the increase of hydrilla finds in 2017, the Local Hydrilla Task force decided to install on September 6 - 7, 2017 five additional benthic barrier mats to help prevent the spread of hydrilla. One barrier to the right of the mouth of Fall Creek and the other four barriers placed in the southeast corner of Cayuga Lake. There was no hand removal before placing these mats down, unlike placement of the 2013 benthic mats. Additionally, on September 20 and October 10, 2017, we found hydrilla, in deeper water, at one location in the southern west side of Cayuga Lake and one location above the Merrill Sailing Center respectively (Figure 2). This is the furthest north we have reported Ithaca hydrilla. We shifted sampling efforts of our 2017 plant survey because of the new found hydrilla by using a 25m X 25m UTM search grid north of the Merrill Sailing Center (cover map). Continued monitoring in front of Stewart Park was essential to determine if any additional benthic barriers need placement to stop further spread of hydrilla.

We were aware of the ongoing introduction of growing hydrilla, hydrilla turions (tubers and vegetative buds) and other species into Cayuga Lake from the Cayuga Inlet and the fast-moving waters of Fall Creek. Our intense rake-toss sampling within the lake bears this out and in 2015 suggests an introduction mechanism as illustrated below (Figure 15). The plant species depicted we identified as Carex sp., a sedge. We do not know the sedge species because all we have found in the Lake's rake-toss samples were shredded leaves and stems. This plant does not grow in Cayuga Lake but likely as an emergent aquatic plant along the edges of the Fall Creek area. As displayed in the figure below, we found the sedge in several rake-toss samples at the mouth of Fall Creek and off the SE shoreline near the Merrill Sailing Center where we located hydrilla growing in late 2015. We also recorded one sedge fragment in deeper water west of the Merrill Sailing Center finds. While waterfowl feed heavily on hydrilla and other plant species in the Fall Creek backwaters, they also release many plant fragments that float to the lake. The likely mechanism of introduction of these sedges and hydrilla fragments is feeding and uprooting by waterfowl and common carp in the backwaters of the Inlet and Fall Creek allowing the moving water to carry fragments into the lake.

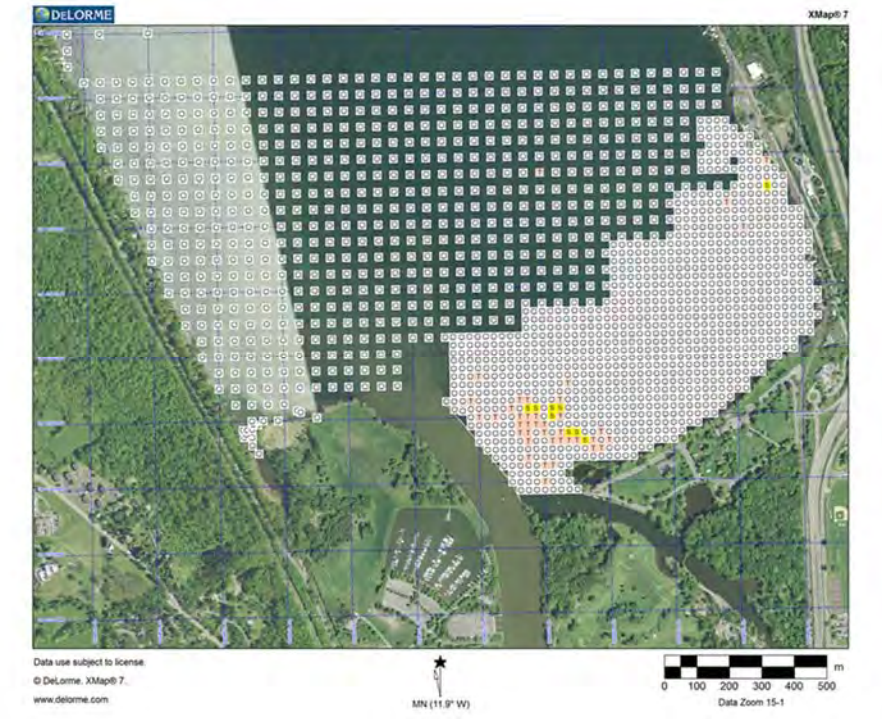

Figure 15. *Carex sp.* (sedge) as abundance in 2015 at the mouth of Fall Creek and east shoreline.

The following website contains detailed information about the 2011 – 2017 Cayuga Inlet, Fall Creek and southern Cayuga Lake hydrilla eradication project.

www.Stophydrilla.org

Methods

The survey team applied a systematic search grid using the line intercept method (Madsen 1999) ADA361270 to hunt for the presence of monoecious *Hydrilla verticillata*. Additionally, we identified all individual aquatic plant species present and estimated the relative abundance of each species to document plant community structure. We sampled and recorded aquatic plant species presence and abundance at pre-selected locations determined by overlaying a UTM grid on maps of the Cayuga Inlet, Fall Creek and southern Cayuga Lake at Ithaca, NY in 2017 (Figure 16). Racine-Johnson Aquatic Ecologists from Ithaca, NY collected the 2017 rake-toss data presented in this report.

We used a basic line intercept sampling method to preselect locations to sample by using a global positioning system (GPS) to guide us to sampling points defined by a geographic information system (GIS). The monitoring crew tossed a tethered dual-headed rake off a boat to collect data from two rake-tosses at each sample point of a 50m X 50m UTM (NAD 83 datum and true north) transect grid. In 2014 and continued through 2017, we added a 25m X 25m grid in areas of high probability for hydrilla presence at the near-shore southern part of the lake. There was also an increase of sampling efforts in our 2017 plant survey by adding a 25m X 25m UTM search grid located north of the Merrill Sailing Center seen on our cover map. Hand-held and/or boat-mounted GPS equipment guided our movement to these locations. Members of the sampling crew tossed the double-headed rake at each selected location and then pulled the rake along the bottom about 10 meters. The individual throwing the rake lifted any plant mass into the boat or to shore. An estimate of overall plant abundance and individual species percentages of the total plant mass from each randomly tossed rake enhanced the basic line intercept method described by Madsen 1999.

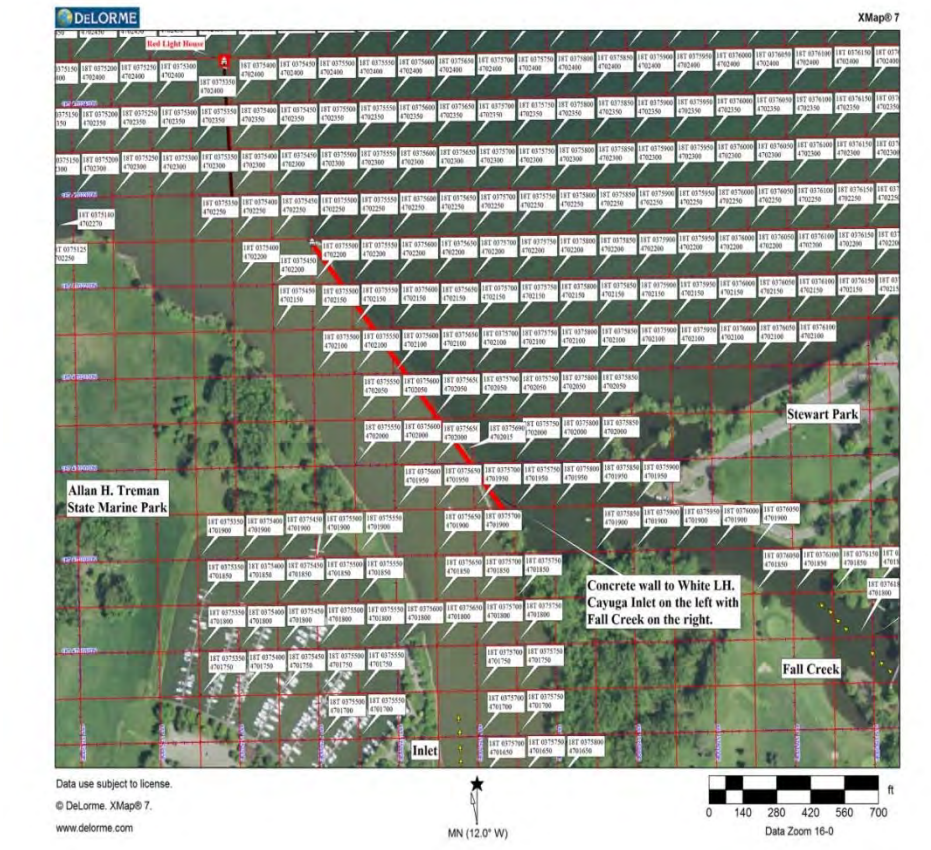

Figure 16. Example of a small section of our UTM grid used to predetermine locations to sample aquatic plant presence and abundance. Locations sampled are at points defined by the line intercepts of the NAD 1983 X coordinate East and NAD 1983 Y coordinate North. We have used this grid method of determining sample locations since 2012 on this project.

The monitoring team then separates each plant mass collected by rake into individual species, analyzes the separations by recording the species identification (Borman *et al*. 1999, Crow and Hellquist 1999) and assigns a percentage estimate of mass to each species (Figure 17). We use a classification of Dense, Medium, Sparse, Trace or Zero to classify the overall plant biomass of each individual rake-toss. A rating of "Dense" is more than an armful and difficult to get into the boat, while an arm-full or when all rake tines are full receives a "Medium" rating. A "Sparse" is when two hands are full or about 50% of the tines on the rake are full, a "Trace" is less than a small handful or when plants are on a couple of rake tines, and a "Zero" is a bare rake.

Figure 17. Sampling team on Cayuga (left) and processing a macrophyte sample from dual-headed rakes by separating to individual species for an estimate of each species' percentage of the whole mass (right).

To obtain an all-species combined (native and non-native) abundance value at a specific location for the pictorial abundance maps of Cayuga Lake, the Inlet and Fall Creek, we simply averaged the two on-water estimated rake abundance categories for the two rake-tosses at each location to produce a mean value. For example, at the sample location if rake-toss one is an armful or all the rake tines very full, we record that plant mass as a Medium or abundance rating of 3 (Table 1). If the second rake-toss at that location amounts to a small handful or less, or if using a similar method estimating amount on the rake as about two tines full on a rake we record as a Trace or an abundance value rating of 1 (Table 1). If we have a rake-toss of a value rating 3 (Medium) and the second rake-toss as a rating of 1 (Trace), we calculate the mean as 2 or a (Sparse) for that location. If we recorded one rake-toss as a (Medium) and the second as a bare rake (Zero), the mean would be a value of 1.5, also a (Sparse), (Table 1).

Table 1. Abundance categories or rake-toss ratings used to describe a collected sample assumes mean dry weight ranges for spreadsheet processing of field data. Our estimate of abundance allows the use of a visual depiction of the mass of all individual species combined as well as the mass of individual species.

Abundance Categories for Mass on Rake Tossed	Rake-toss Abundance Number	Dry Weight (g/m^2) Ranges associated with Total Plants Abundance	Mean Biomass (g/m^2)	Dry Weight (g/m^2) Ranges associated with Single Species Abundance
"O" = no plant(s)	0	0.0	0.0	same
"T" = trace plant(s)	1	~0.0001 - 0.9999	0.5	same
"S" = sparse plant(s)	2	~1.0000 - 24.9999	13.0	same
"M" = medium plant(s)	3	~25.0000 - 99.9999	62.5	same
"D" = dense plant(s)	4	~100.0000 - 400.0000+	250.0	same

We based our abundance analysis for each rake-toss on our broad categories of rake-toss abundance reported in the field. Our abundance ratings originated from assumptions based on the biomass (g/m^2) relationship to rake-toss rating shown in (Figure 18) and determined by field experiments.

After observational data collected from pre-determined locations in Cayuga Lake, Cayuga Inlet and Fall Creek arrives at our office, members of our team enter the information into MS Excel spreadsheets, check the spreadsheet for data entry errors, perform analysis and list in a report. We specifically summarize the individual rake-toss results from the data tables and show in Table 2 (pg. 30) of this report. Data tables 1- 7 in the appendix are the actual field collected observations which we transform into pictorial depictions that appear as abundance values on Lake maps in Map Lake-1 through Map Lake-22. We created abundance maps for Inlet early summer in Map Inlet-1 through Inlet-14, Inlet early fall in Map Inlet-15 through Inlet-29, Fall Creek pre-herbicide in Map Fall Creek-1 through Fall Creek-12, Fall Creek post-herbicide in Map Fall Creek-13 through Fall Creek-25.

We show in Figures 1 – 10 specific depictions of hydrilla locations. Specific coordinate locations of new hydrilla finds in 2017 are in the appendix of this report as a table, Coordinates 1. Additionally, we recorded this data on the *i*MapInvasives website owned by NatureServe. http://www.imapinvasives.org/new-yorklogin

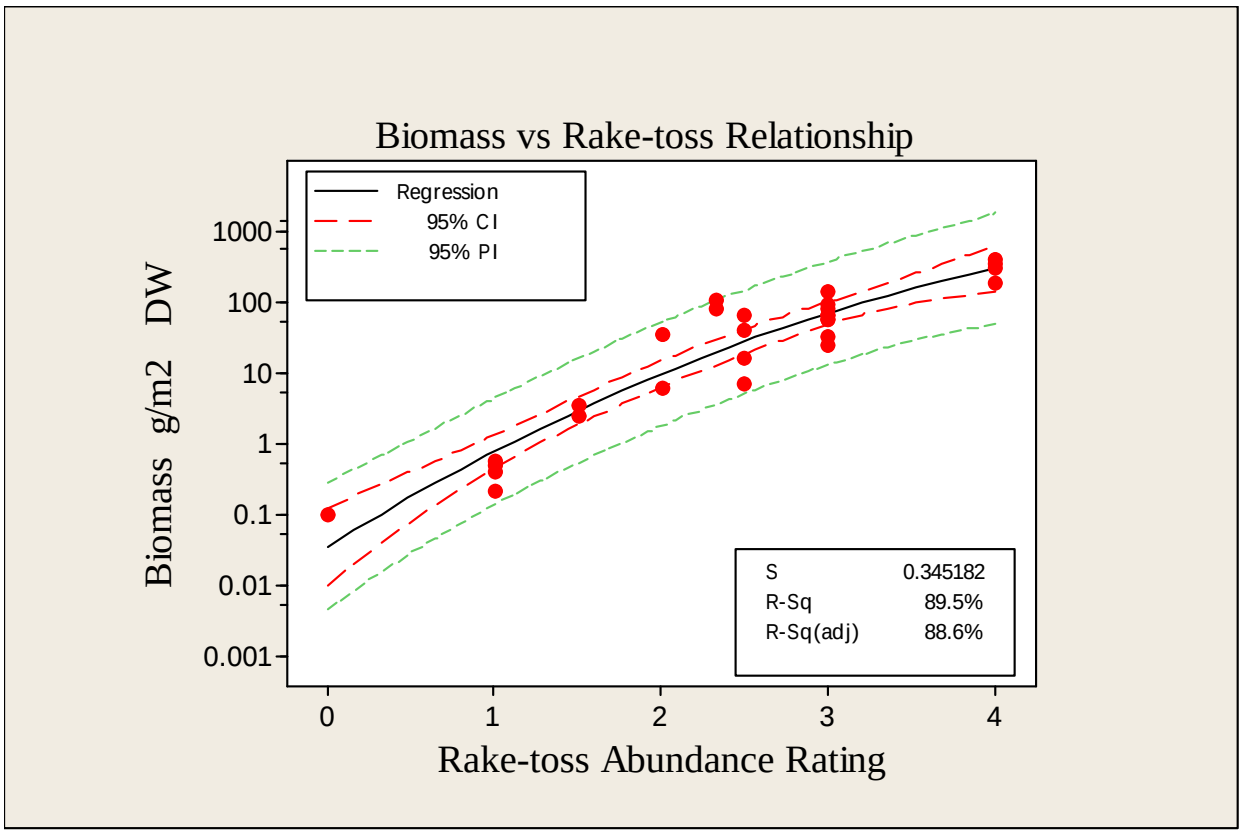

Figure 18. Best-fit line to describe the relationship between onsite estimates of abundance made with the rake-toss method of collection contrasted with an estimate of biomass (three individual in-lake biomass quadrat experiments with a description following determine the regression equation).

To analyze the abundance data of individual species, we used the values in Table 1. Specifically, the standard assumed abundance rating or category as it relates to dry biomass (g/m^2). Figure 18 describes the foundation for Table 1 concluded from experiments conducted in Chautauqua Lake, NY during 2006 and 2007 (Johnson 2008). Along with additional data collected in 2011, we contrasted the "rake-toss" estimates at specific locations to the absolute dry biomass data collected from the same locations at the same time.

We used 28 lake locations, collected five 0.25m^2 quadrat samples from each location for a total of 140 biomass samples and determined dry mass by drying the quadrat samples to 105^{o}C. We calculated a mean biomass dry weight (g/m^2) for each of the 28 locations. From this quadrat biomass sampling and the accompanying rake-toss estimate of abundance, we determined the best-fit regression line shown in Figure 18.

In practice using the relationships in Table 1 and the 2017 rake-toss data sets, we calculated mean species abundances for each location sampled by using the field percent estimate of each biologist's rake-toss. With the use of GIS, we placed the resulting abundance values on individual species maps for each sampled location to create a visual record of the relative species abundance for all locations. These include: Cayuga Lake, the relative species abundance for the early summer and early fall Lighthouse area, early summer and early fall Inlet proper and pre- and post-2017 herbicide applications at Fall Creek.

In the Results section following, the Cayuga Lake abundance maps show the rake-toss results for the southern end of Cayuga. We included these results in detail in Table 2 and Data 1, but summarized on the Cayuga Lake Maps. The Results section also refers to the Lighthouse area (LH) in Table 2, Figure 19, Pie charts and listed in rake-toss Data 2 and Data 3. Figure 19 below shows the 29 (50m X 50m) locations of the Cayuga Inlet at the entrance to Cayuga Lake, described as the Lighthouse area (LH), now 30 locations. We feel this area (LH) needs to be a separate grouping from the Inlet "proper" evaluations because of the location at the intersection zone of the Cayuga Inlet and Cayuga Lake. We treat the area distinctly in this report.

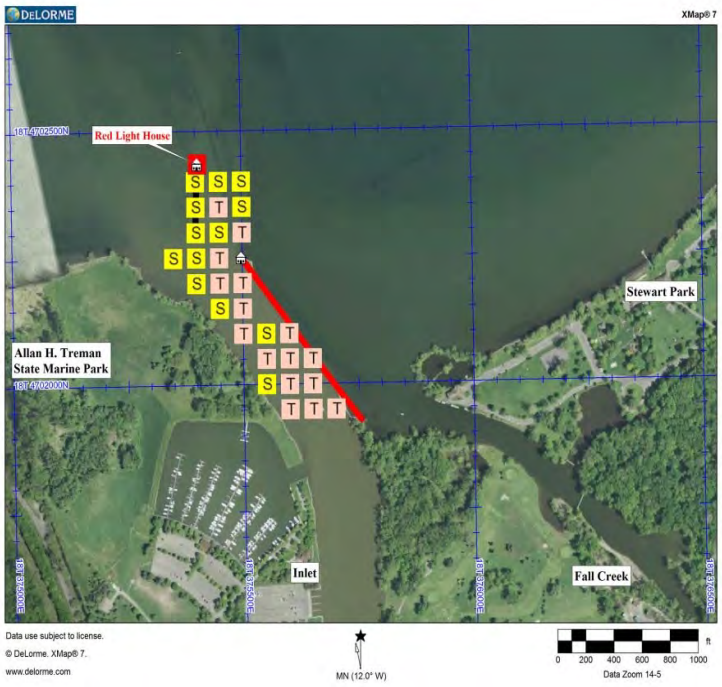

Figure 19. Map is of the Lighthouse area (LH) in 2013 with the 29 sampling locations at the transition zone between the Cayuga Inlet and Cayuga Lake. In 2014 through 2017, we evaluated by rake-toss 30 sampling locations both early summer and early fall.

Determining the density of subterranean hydrilla turions (tubers) within the area of previous hydrilla growth is a very important monitoring task that attempts to address potential future emergence of hydrilla from residual tubers and shape decisions of future treatment strategies. Since fall of 2011 and the identification of hydrilla in the Cayuga Inlet, we have been measuring tuber density (number of turions per unit area) in areas that initially had dense vegetative growth of hydrilla. Summary graphs of mean tuber density numbers over several years at our chosen 7 historical locations follow in the results section of this report. Graphs are an estimate of the mean tuber densities at a 95% confidence interval with the error pooled across groups. We increased sample size greatly as the tuber population decreased. We eliminated tuber sampling in 2017 because numbers likely reached 0.

Figure 20 below describes the locations where our method of determining hydrilla turion (tuber) densities using the "Haller Hydrilla Sediment Corer", a post-hole digger that produces consistent sized cores from the sediments of the Cayuga Inlet and Fall Creek infestation. The corer removed a sediment plug with a surface area of 173 cm^2 and was approximately 22 cm in length that we placed in an individual plastic bag. Our initial measurements suggested most of the tubers in the Cayuga Inlet, Fall Creek and southeast corner of Cayuga Lake are resting at 10 to 15 centimeters down from the sediment surface. We processed cores individually by hand washing the sediment through fine mesh screens. At the washing station, the biologist separated the collected tubers into germinated or non-germinated growth stages. Prior to December 4, 2012, the tuber sampling crew collected ten cores at each of the four original Cayuga Inlet locations on each sampling date. From December 2012 to May 2014, we increased the numbers of cores from each location to 22 collected on each date. In June of 2014, we increased the number of cores collected on each date to 104 per location and starting in December of 2014, we doubled the number collected to 208 per location and continue that number through 2016. With a collection of 208 cores per sampling location on a date, we are sampling a minimum of 3,000 pounds of wet sediment from each location collected on a date to determine tuber density. The Hydrilla Task Force decided that we would not collect sediment samples in 2017 due to the decreasing presence of tubers in 2015 and 2016.

Figure 20. Map above shows the four locations in the Cayuga Inlet and three in Fall Creek where we routinely conduct sediment core removals, while the three additional photos show sample collection and processing.

Tuber density graphs in the results section show in the top graph total tubers found (germinated and non-germinated) and, in a second graph, non-germinated tubers found per 173 cm^2 surface area. The non-germinated tuber graph is an estimate of propagules (tubers) left in the sediment that have the potential to germinate and grow sometime in the future.

Results

This report summarizes and displays the results of the 2017 aquatic plant species monitoring along with 2011 – 2017 aquatic plant and hydrilla tuber monitoring history for Cayuga Lake and the Cayuga Inlet (Johnson 2013, 2014, 2015, 2016 and 2017). We summarize and display the results of the 2017 aquatic plant species monitoring of Cayuga Lake, the Cayuga Inlet and Fall Creek in the tables and figures that follow. Table 2 (page 30) summarizes the relative frequency of individual aquatic plant species collected by the rake-toss survey method in Cayuga Lake, the Lighthouse (LH) inlet area, the Cayuga Inlet proper and Fall Creek in 2017. Figures 22 – 24 depict in bar graphs relative frequency from 2012 – 2017.

In analyzing the recorded data, we suggest caution and point out that our observations are a point-in-time at a point location. Natural factors that primarily influence aquatic macrophyte (plant) communities are general seasonal growth patterns of a single species, available light and space, wave action and competition between species often strongly influenced by propagule production of individual species. Many other factors can also influence growth, but generally to a lesser extent, such as available nutrients, sediment types and herbivores.

Figure 21 below is an example showing contrasting abundances of the dominate species *Elodea sp.*, a native and *Nitellopsis obtusa* (starry stonewort), a non-native macro-alga, from the lake survey and are examples of the following Map Lake-1 through Map Lake-22 (pages 49-70). Similar maps follow for the Cayuga Inlet for both early summer and early fall evaluations as Map Inlet-1 through Map Inlet-29 (pages 71-99) along with Fall Creek for both pre-herbicide and post-herbicide evaluations as Map Fall Creek-1 through Map Fall Creek-25 (pages 100-124). Maps also show increased sampling areas on the east shoreline north above the Merrill Sailing Center in 2017 on a 25m X 25m UTM grid to improve chances of locating isolated hydrilla.

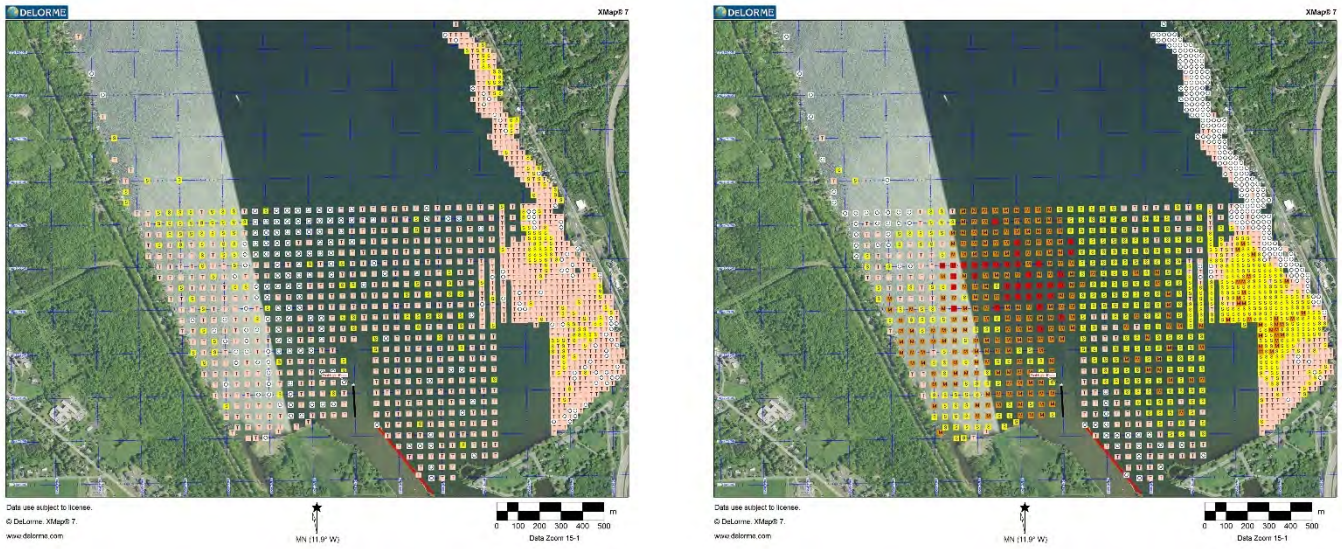

Figure 21. Maps of relative abundance of the dominate native species *Elodea sp*. (left) and non-native macro-algae invader *Nitellopsis obtusa* (starry stonewort) (right), a major dominate plant in southern Cayuga.

The 2014 post-herbicide evaluations of the Cayuga Inlet reported growing hydrilla at the Cornell University Boathouse Bay, suggesting that previous herbicide treatments (endothall one application followed by continuous drip of fluridone) that have worked very well in the Cayuga Inlet allowed growth at this location in 2014. We did not know if this hydrilla found at the Boathouse Bay matured enough in 2014 to produce new tubers. However, this discovery emphasizes the need to increase adequate monitoring in the future to locate new growth of hydrilla quickly in treated areas and of primary importance to prevent possible new hydrilla tuber formation. We did find and removed by hand high numbers of viable tubers in December 2014 from this location and interestingly did not have any further hydrilla growth in 2015 to the end of 2017 at the Cornell University Boathouse Bay.

In Fall Creek, with the high velocity stream flow, heavy feeding by waterfowl and major disturbances by common carp in the creek and backwaters continue to be a major challenge to the task of eliminating hydrilla. This is the area where, after the discovery of hydrilla on August 8, 2013, a major rainstorm that evening caused at the very least, thousands of hydrilla fragments and numerous turions to enter the lake from the new Fall Creek infestation.

While this and earlier reports contains a large data set of aquatic plant information, we suggest caution with any in-depth analysis despite some possible recent trend lines. Individual species have very different annual life cycles and can vary greatly in plant occurrence and mass throughout each seasonal growth period due to distinctive phenology. These changes in plant mass of individual species may occur rapidly over as short of a period as two weeks while our collection of field data is much longer.

While there are likely possible herbicide effects on non-target species presence and abundance from pre-treatment to post-treatment within the Lighthouse area, Inlet and Fall Creek, we cannot suggest long term effects because we have just stopped herbicide treatments in the Inlet of endothall at the end of 2015 and of fluridone at the end of 2016. The data to date has not suggested any negative long-term effect on native or non-native plant presence or growth except for the target plant hydrilla.

However, tracking the frequency of occurrence presented in Figures 22, 23 and 24 a few possible trends emerge. We do see in Figure 23 (bottom Inlet early fall 2017) two likely significant increases from the previous 5 years in percent of occurrence of the invasive *Najas minor* and the native *Potamogeton pusillus*. Figures 25 (Inlet "proper") and 26 (LH, "lighthouse locations") confirms these dramatic increases with pie charts. A possible conclusion might be that the stopping of herbicide treatments since 2011 in the Inlet could influence these increases in occurrences.

Additionally, when comparisons of relative abundance ratings of all species combined, for years 2012 - 2017 shown in Figures 27-32 following, differences in plant mass from year to year are very few. The abundance ratings or categories estimating mass of all aquatic plants in total, changed very little from one year to the next for Cayuga Lake.

Overall, the aquatic plant community in Cayuga Lake remains relatively stable when considering occurrence and mass with larger shifts between individual species through the growing season. We do note a very large presence in the occurrences and mass of the macro algae *Nitellopsis obtusa* in Cayuga Lake 2013 – 2017 from survey measures in the year 2012. This plant species continues to slowly expand its range in southern Cayuga Lake since Racine-Johnson Aquatic Ecologists first reported *Nitellopsis obtusa* from plant sampling of southern Cayuga in 2008. The field-recorded rake-toss data are in tables Data 1 - Data 7 (pages 154-290) and new locations of hydrilla discoveries in 2017 are in table Coordinates 1 (page 291). Our hydrilla locations found in 2017 are on the web in "*i*MapInvasives" owned by NatureServe. http://www.imapinvasives.org/new-yorklogin

The graphs Tuber 1 through Tuber 7 following (pages 42-48), show the rapid depletion of tuber numbers within the sediment from the initial discovery at all locations. These results appear to be in line with early research (Netherland 1997) that tubers may remain in the sediment up to four years before germinating. Our data suggests that longer time frames of management of hydrilla by herbicides to eradicate previously produced tubers may be excessive at specific locations.

Table 2. Relative Frequency (%) of aquatic plant species in 2017 recorded by the line intercept grid survey in Cayuga Lake, the Lighthouse Area (LH), the Cayuga Inlet proper and Fall Creek. Included are the early summer and early fall evaluations of the Lighthouse area (LH) and the Inlet along with the pre- and post-herbicide evaluations Fall Creek.

Figure 33. Historical locations of the hydrilla tuber sampling areas where we collected sediment samples. Hand washed sediment samples through fine mesh screens determined hydrilla tuber presence and density. In 2017, we did not collect sediment samples from any of these locations.

Table 3. Hydrilla tuber density from 2014 to 2016 summarized by date collected, location, number of sediment cores removed, total tubers (sprouted + un-sprouted) recovered and the number of total tubers that had not sprouted. Location SI is the Inlet south of the Rt. 79 Bridge. FM is in Cascadilla Creek near the Farmer's Market. CUB is the bay at the Cornell University Crew Boathouse. LI is in the Cayuga Inlet at the mouth of Linderman Creek. GCL is the lagoon in Fall Creek at the Golf Course. SP is the pond off Fall Creek at Stewart Park and FCC is the small cove on the east side of Fall Creek southeast of the footbridge crossing Fall Creek at Stewart Park. There were no sediment samples collected in 2017.

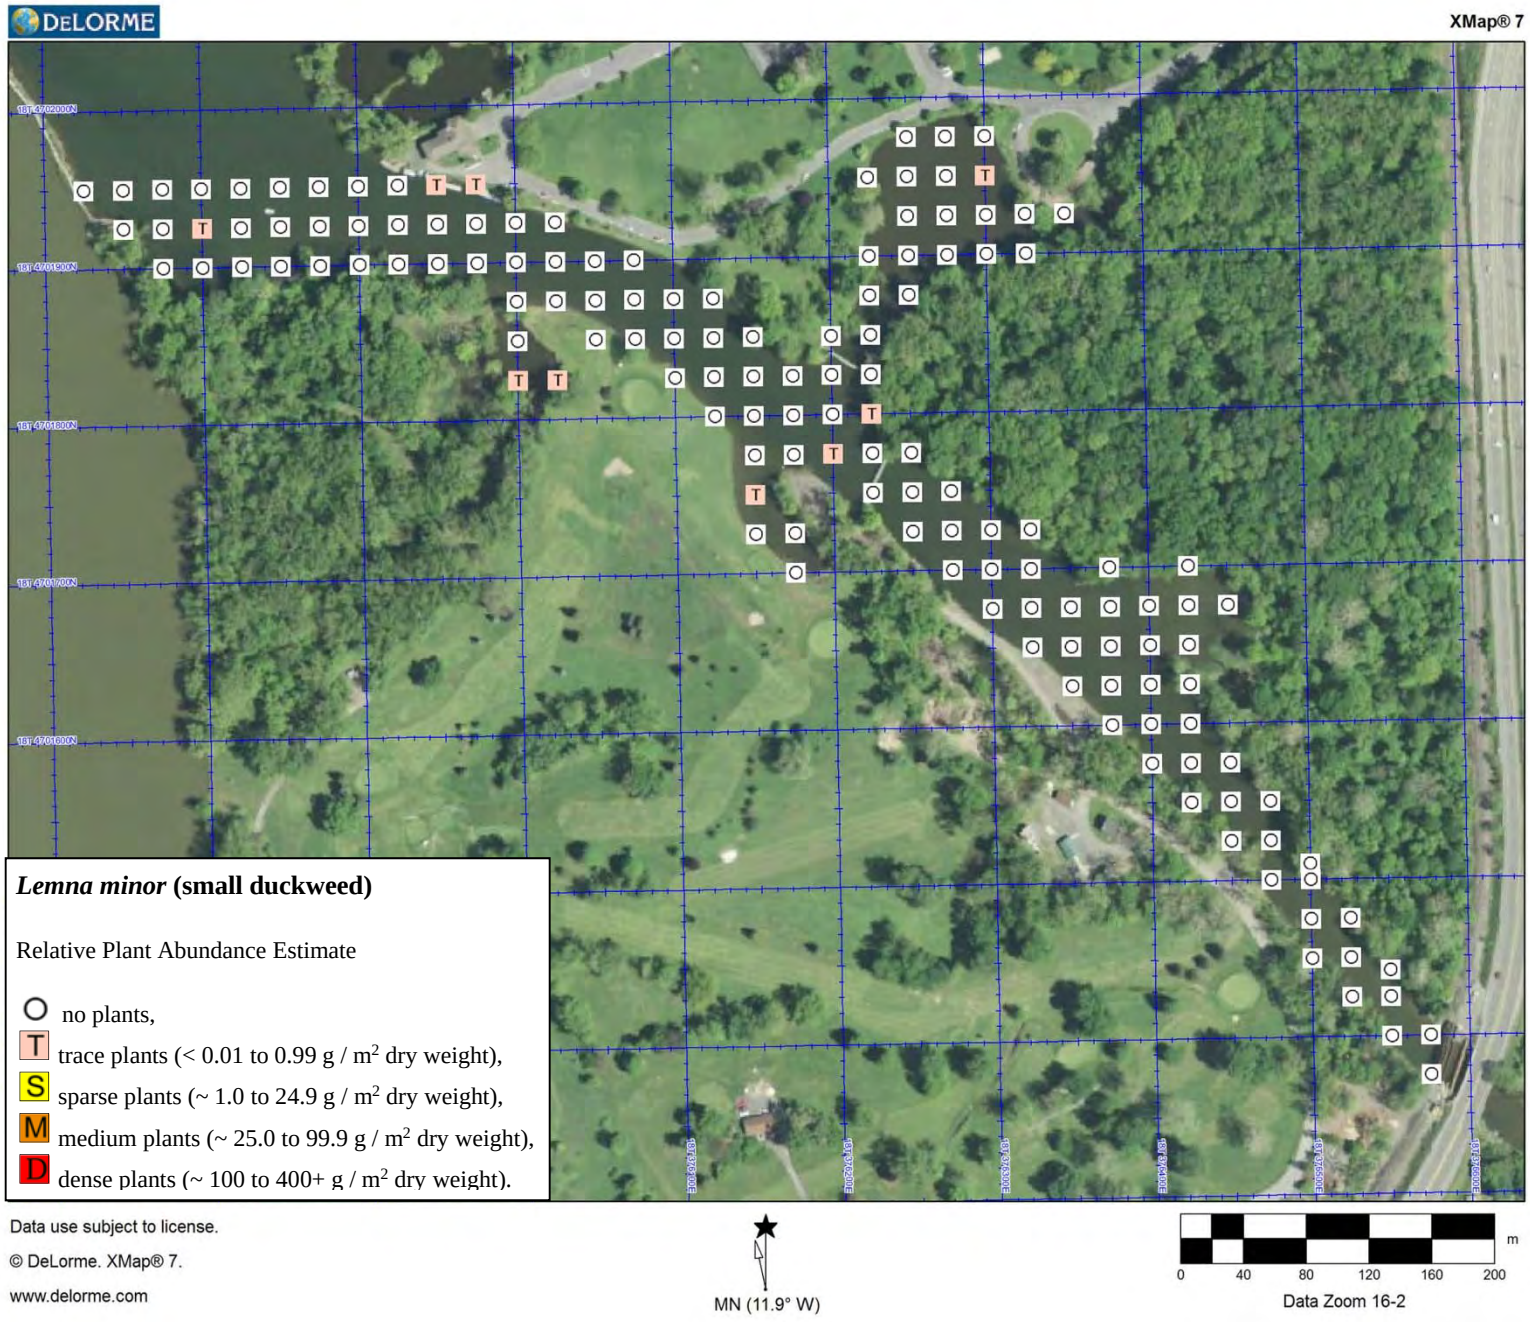
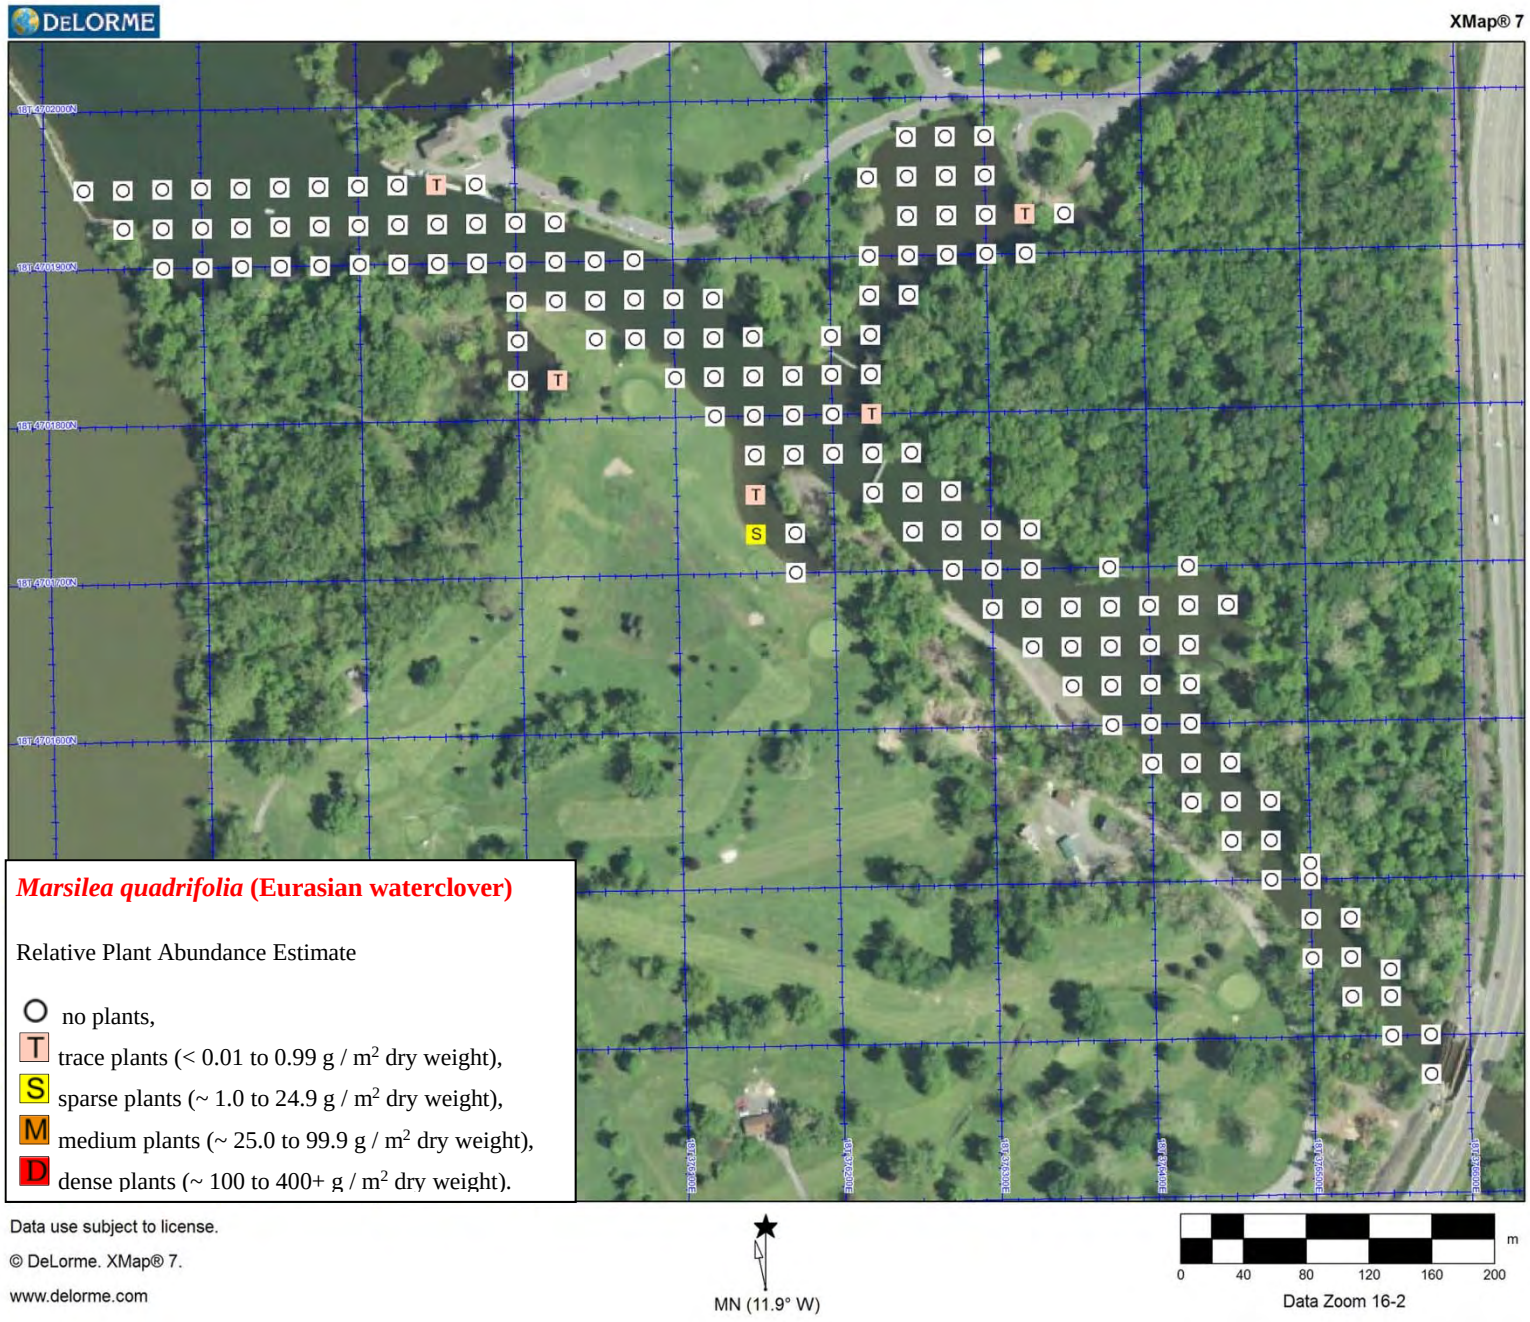
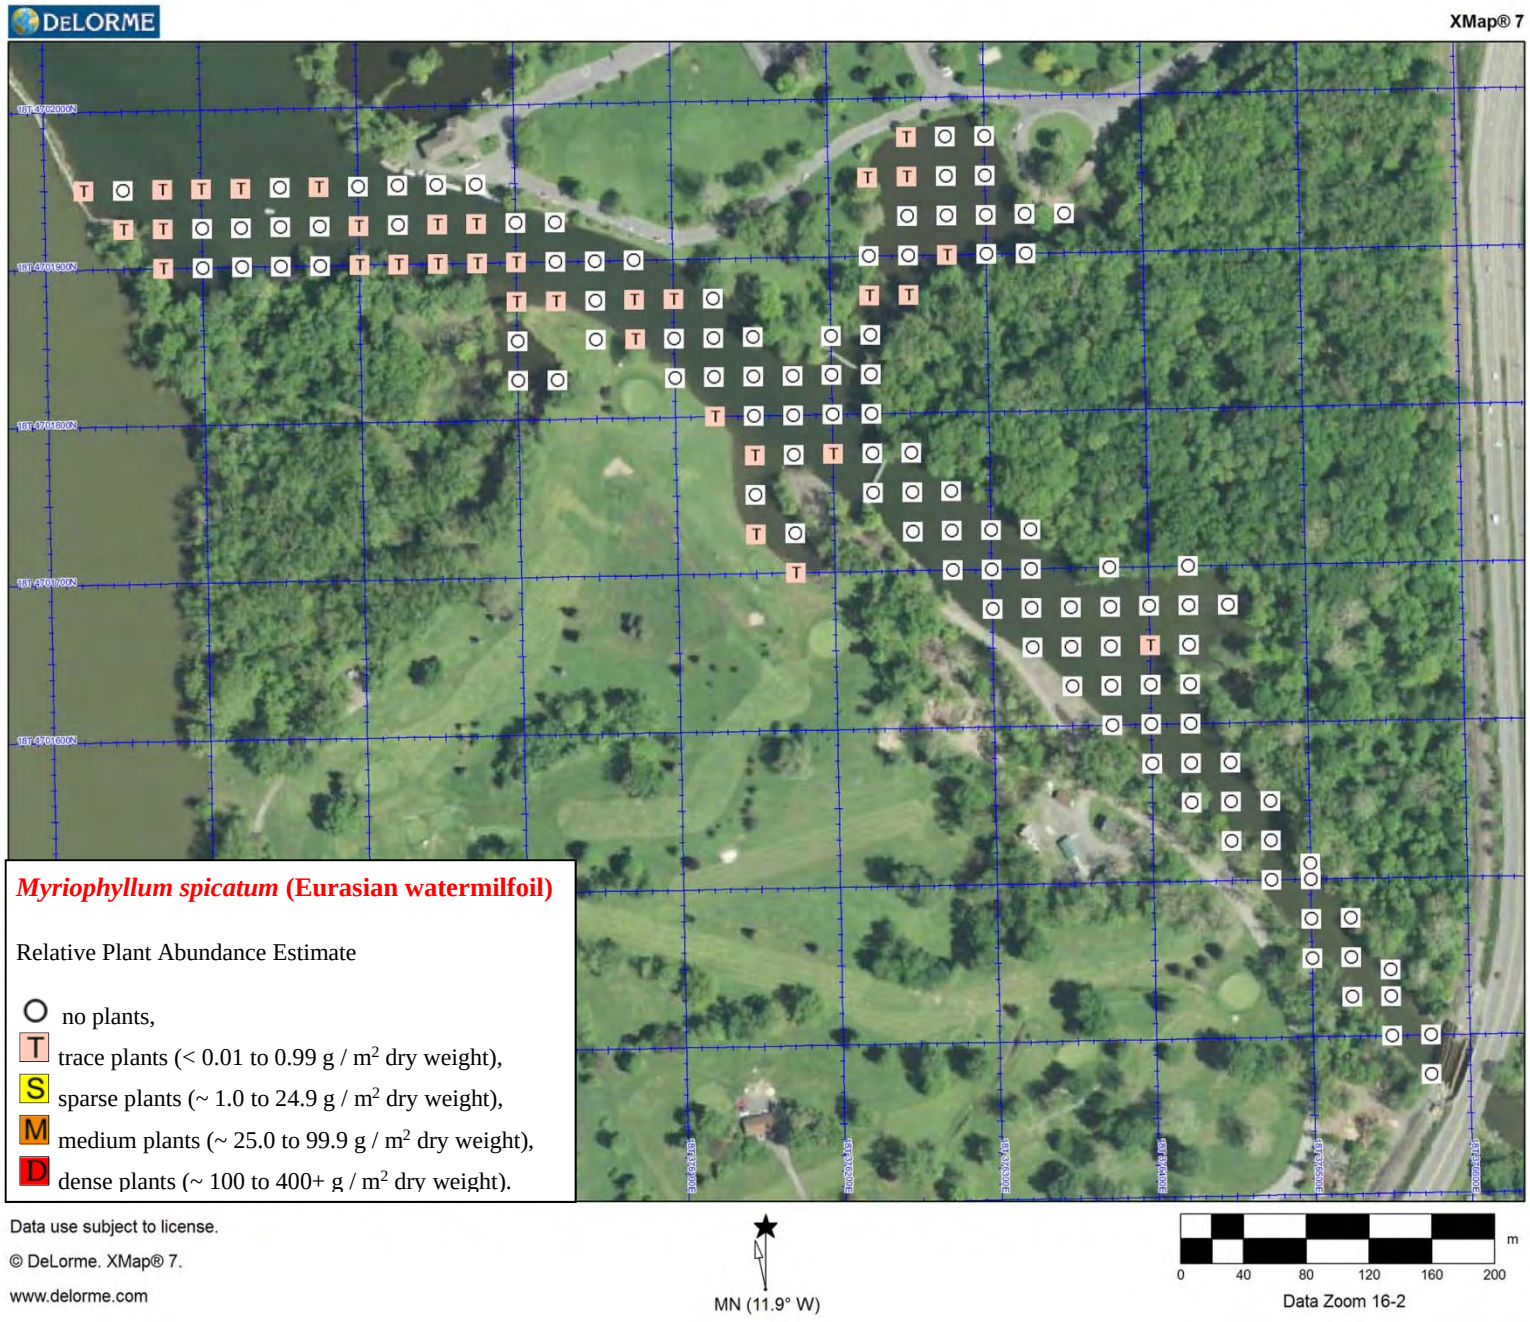
Map Fall Creek-18. *Hydrilla verticillata* (hydrilla) post-herbicide as abundance by two rake-tosses in 2017.



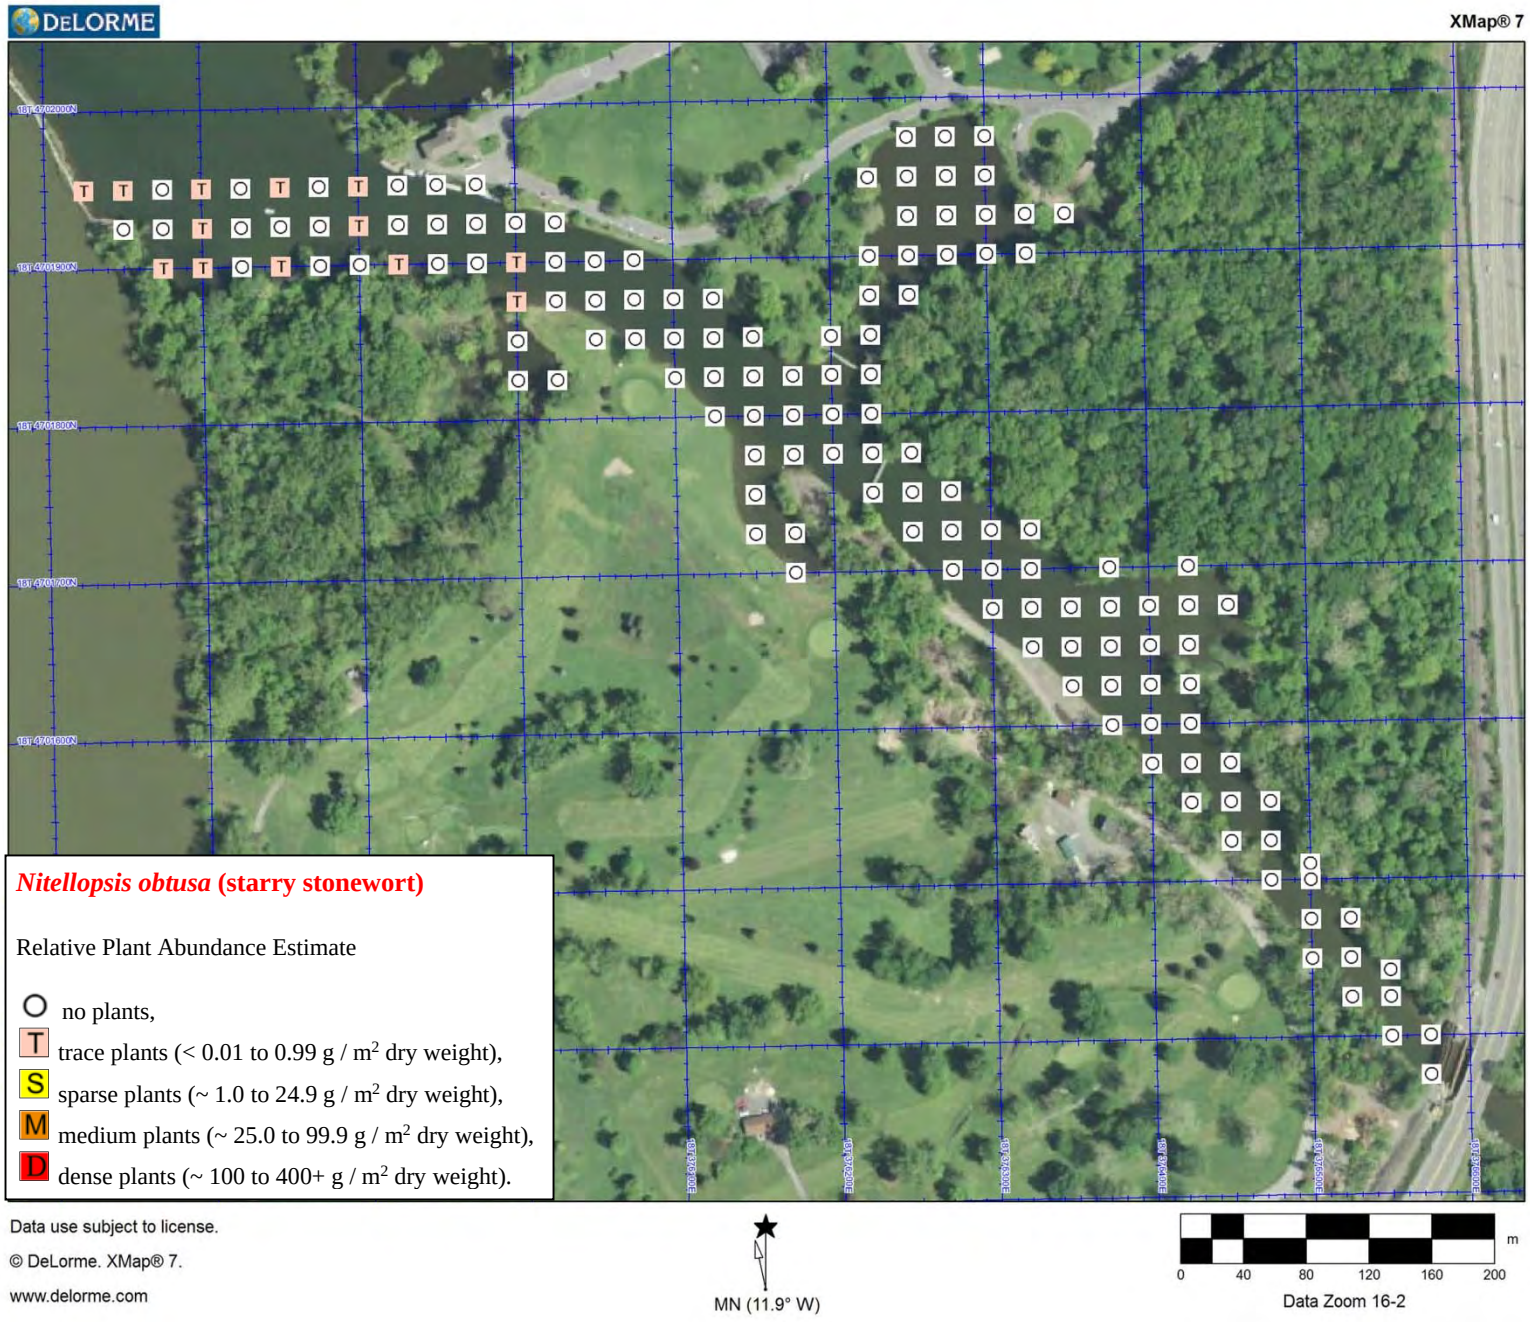
Map Fall Creek-19. *Lemna minor* (small duckweed) post-herbicide as abundance by two rake-tosses in 2017.



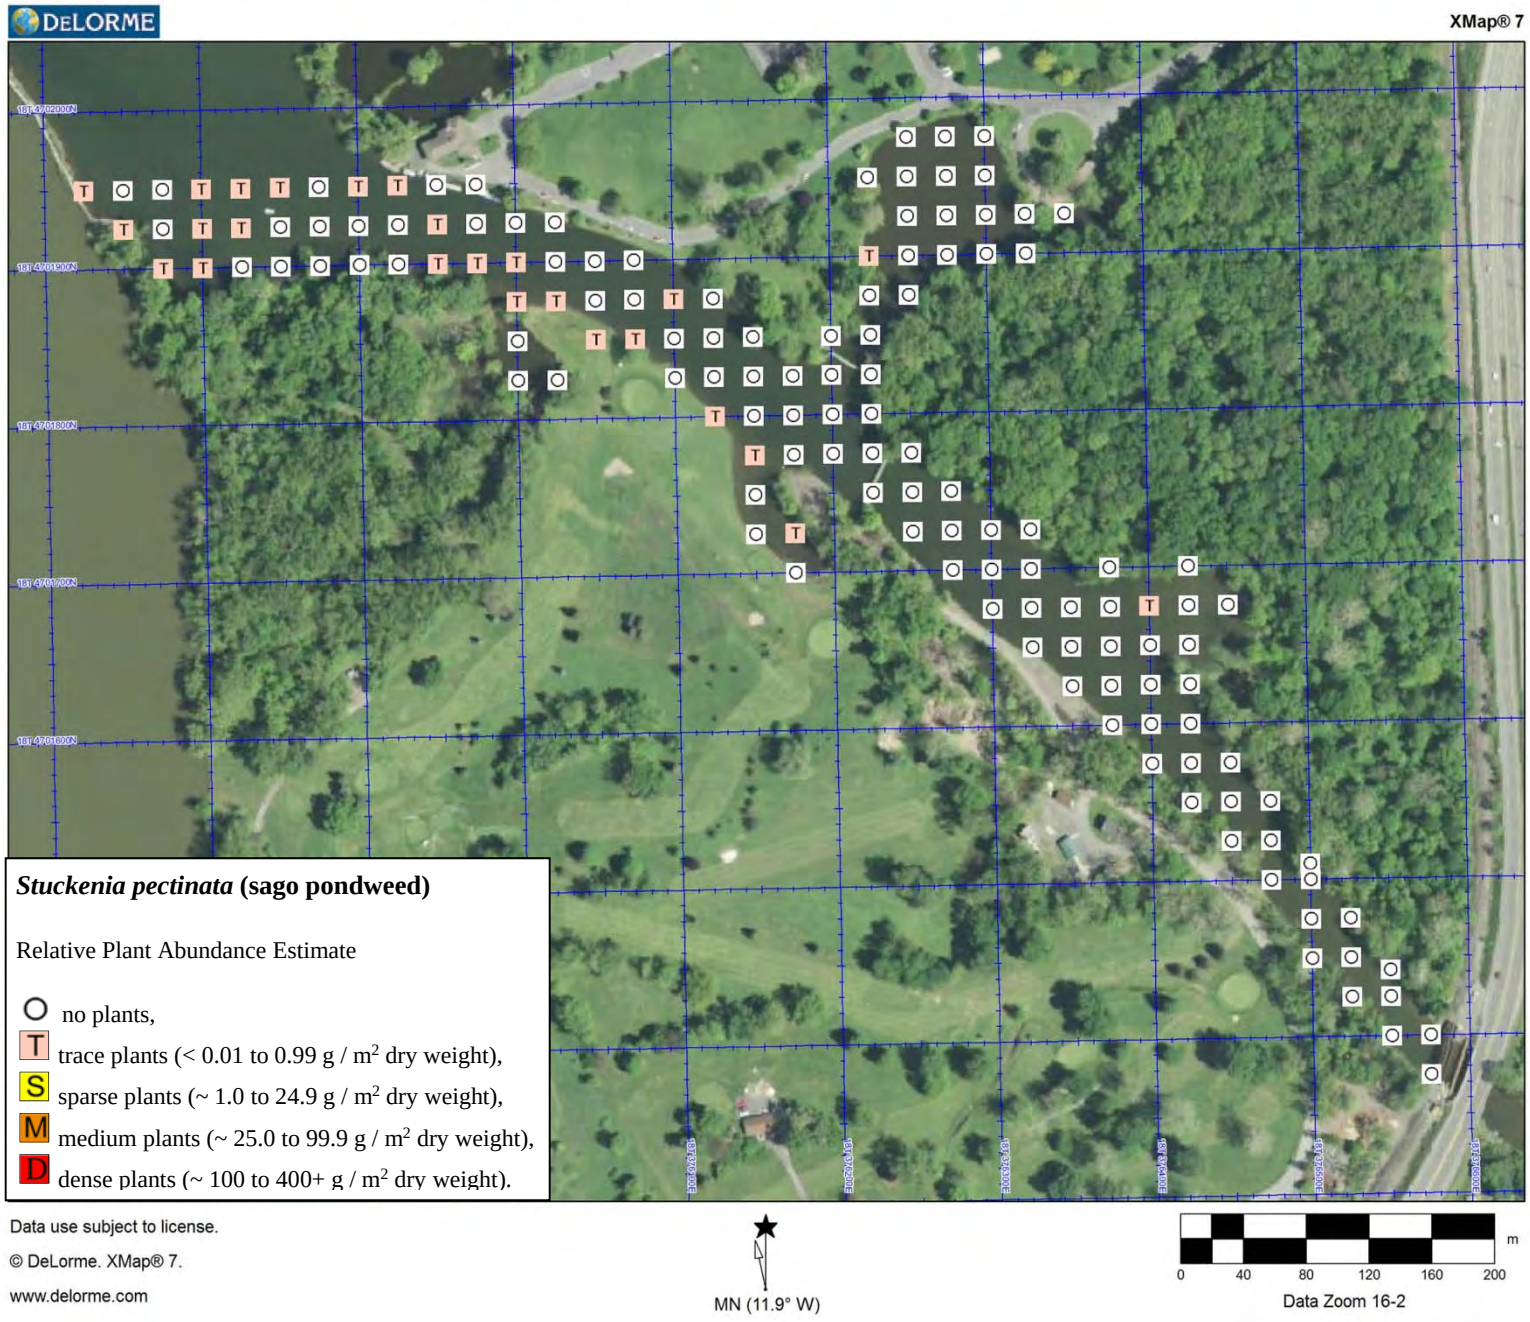
Map Fall Creek-20. *Marsilea quadrifolia* (Eurasian waterclover) post-herbicide as abundance by two rake-tosses in 2017.



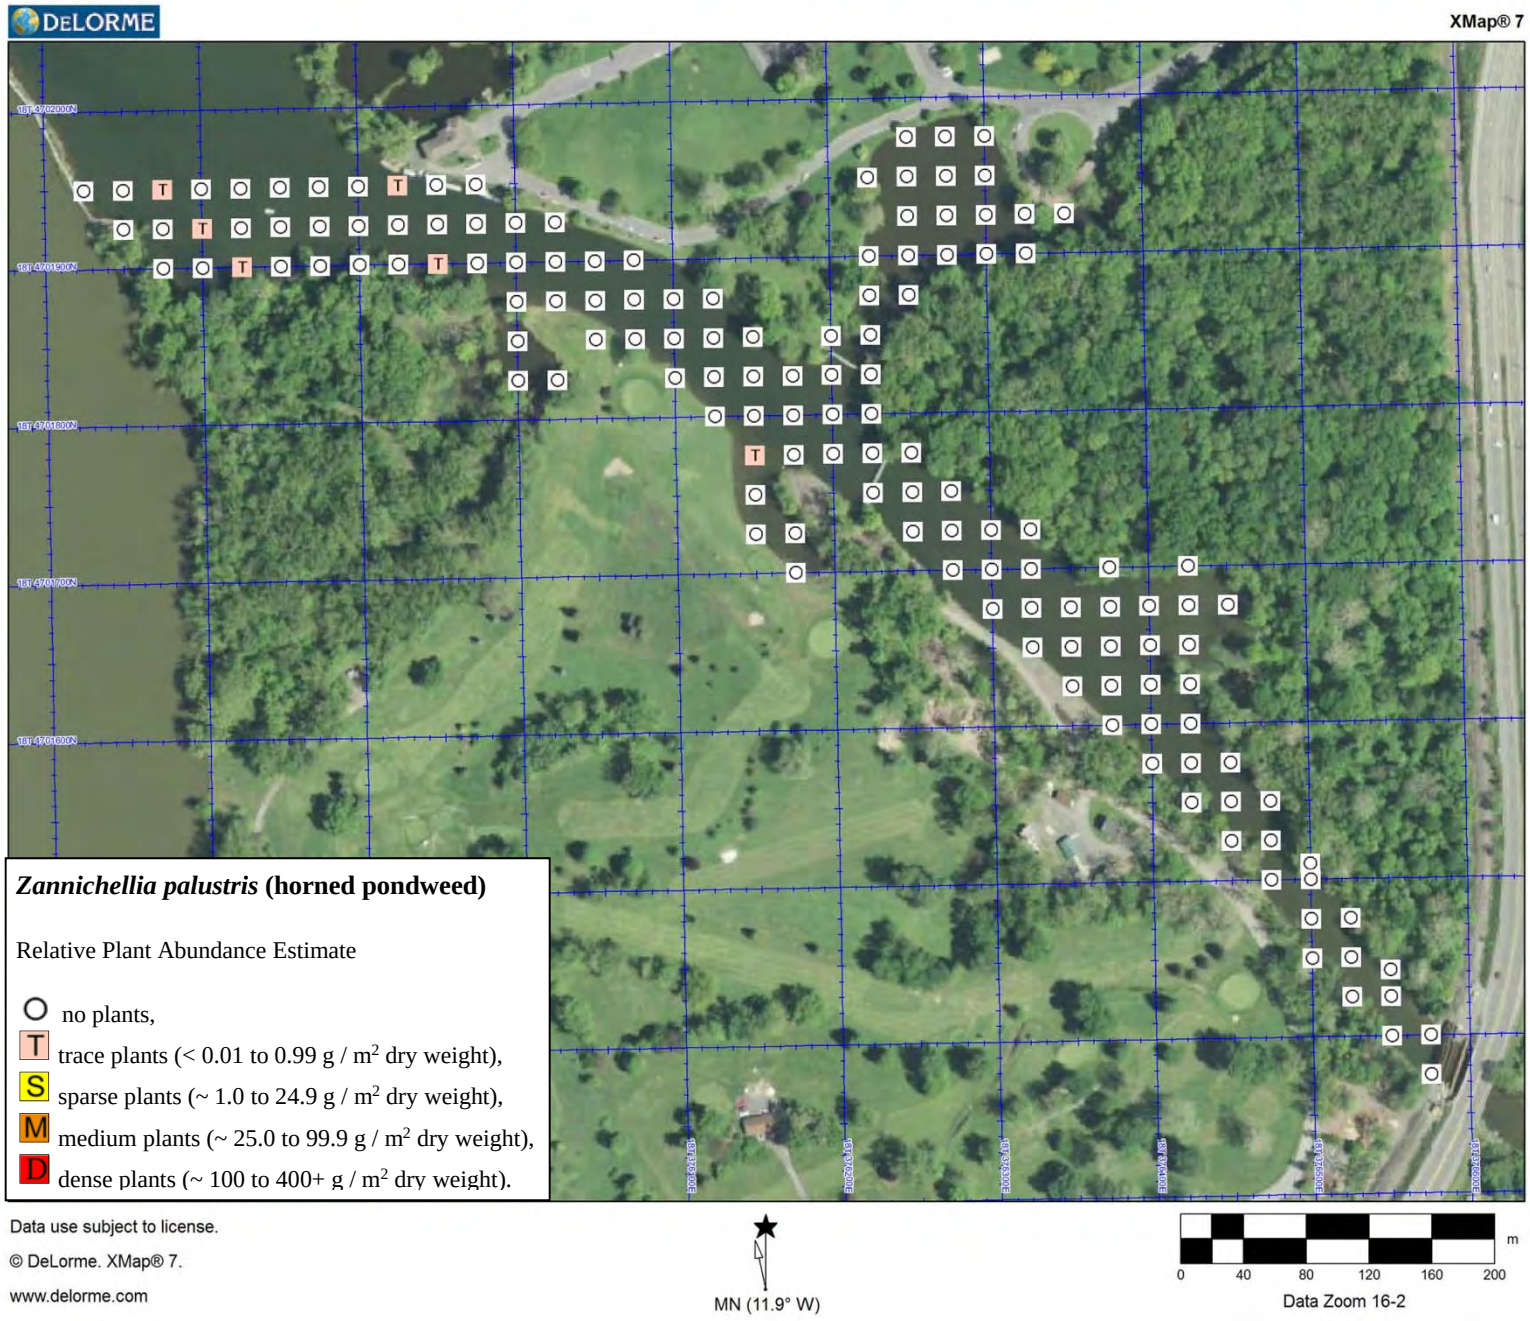
Map Fall Creek-21. *Myriophyllum spicatum* (Eurasian watermilfoil) post-herbicide as abundance by two rake-tosses in 2017.



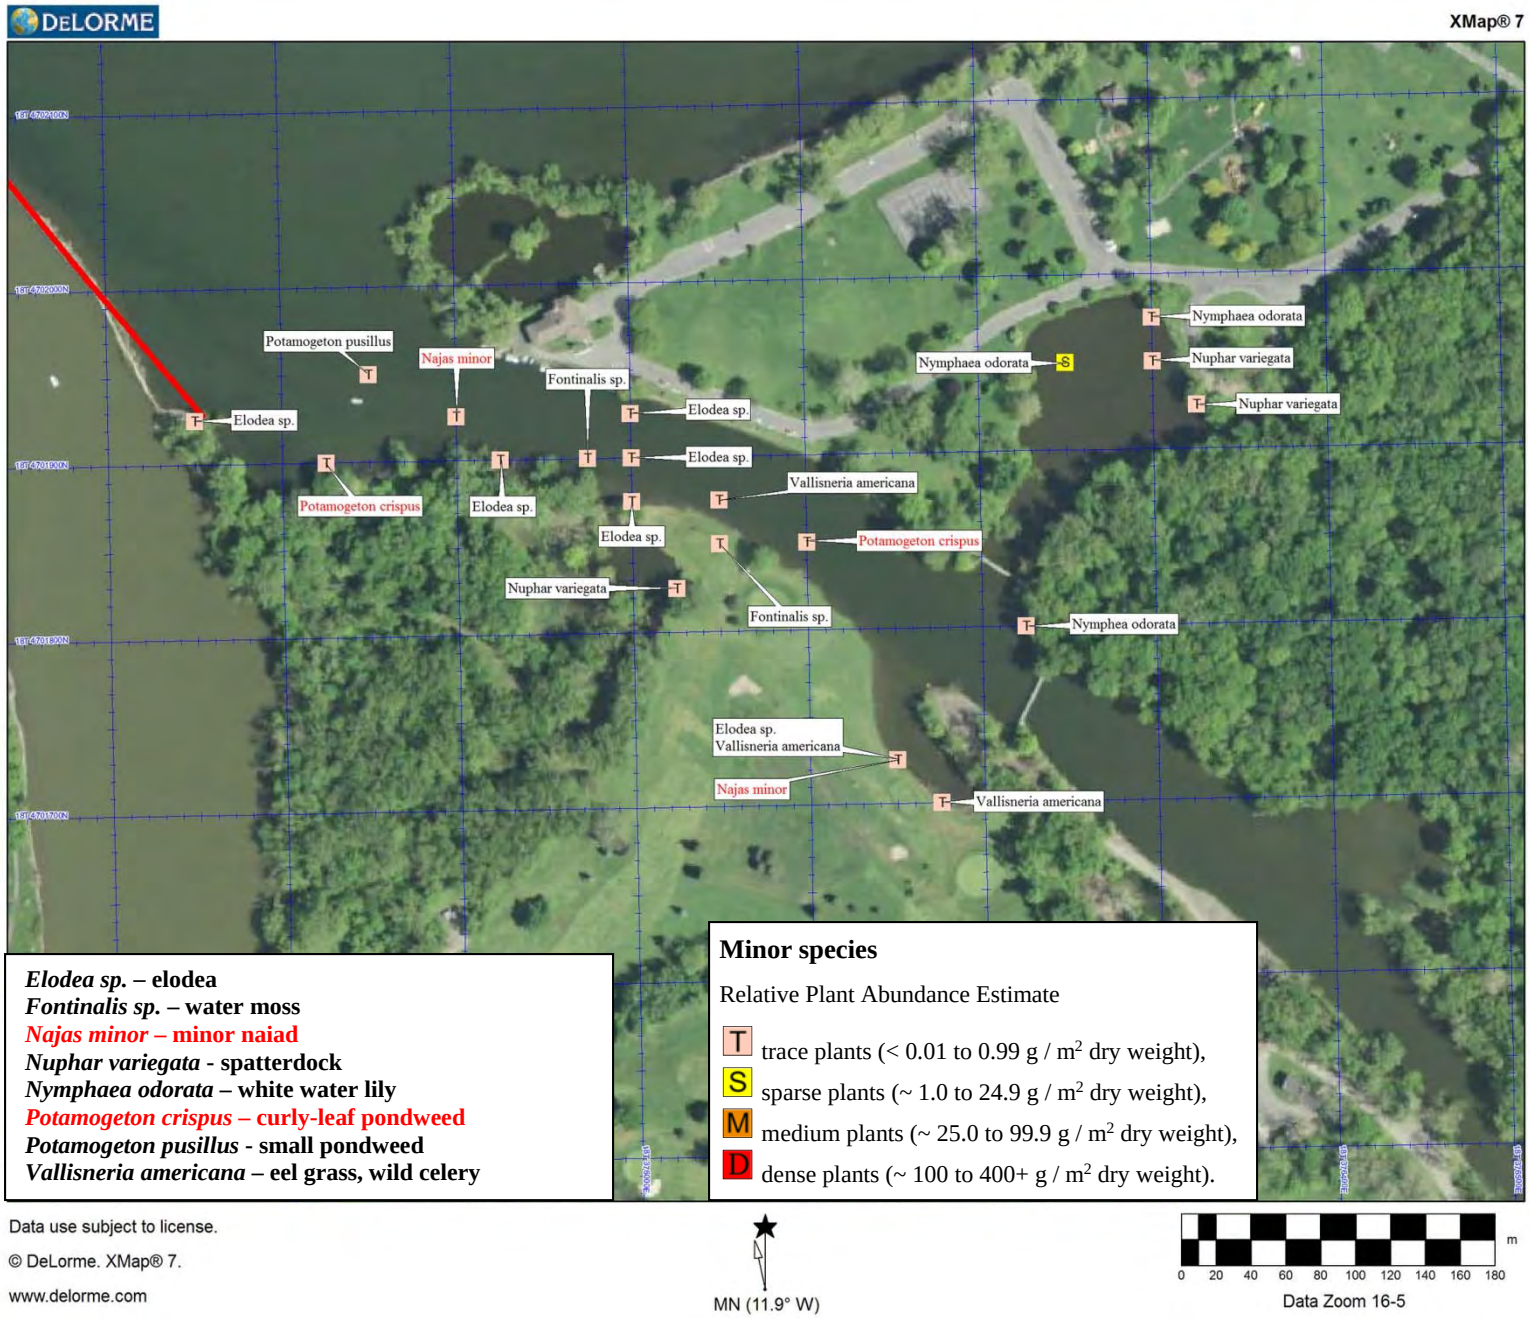
Map Fall Creek-22. *Nitellopsis obtusa* (starry stonewort) post-herbicide as abundance by two rake-tosses in 2017.



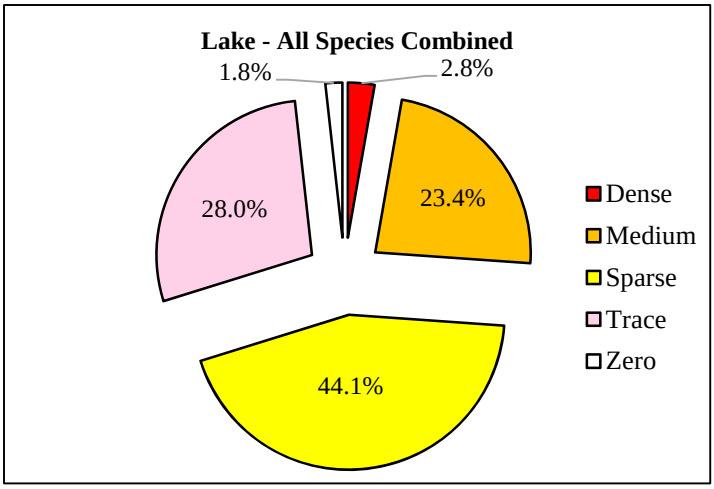
Map Fall Creek-23. *Stuckenia pectinata* (sago pondweed) post-herbicide as abundance by two rake-tosses in 2017.

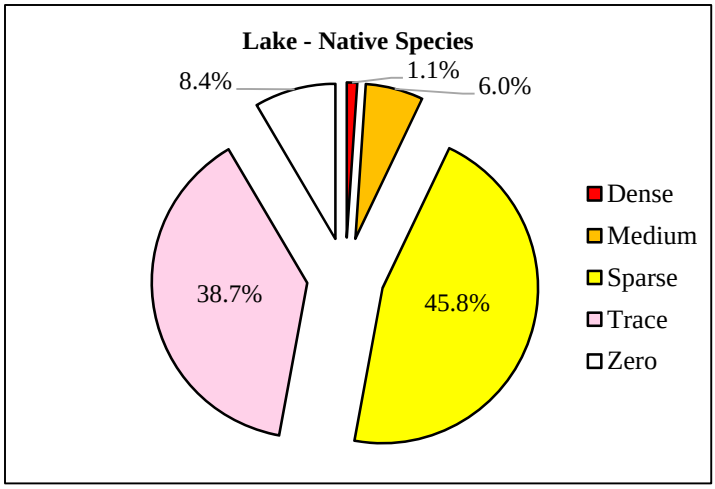


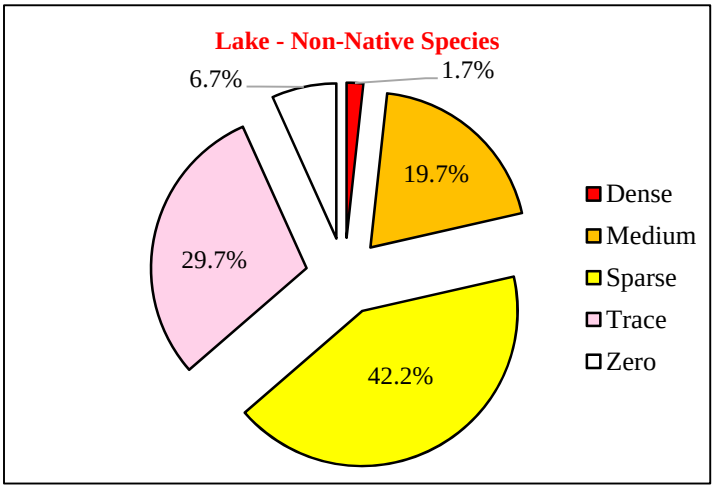
Map Fall Creek-24. *Zannichellia palustris* (horned pondweed) post-herbicide as abundance by two rake-tosses in 2017.

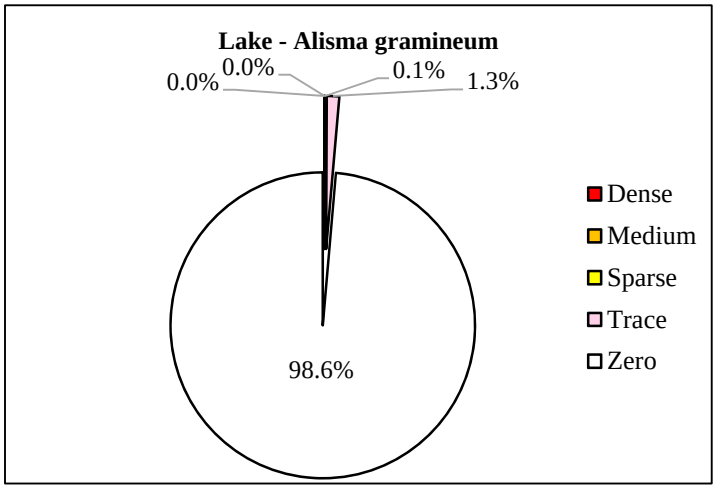


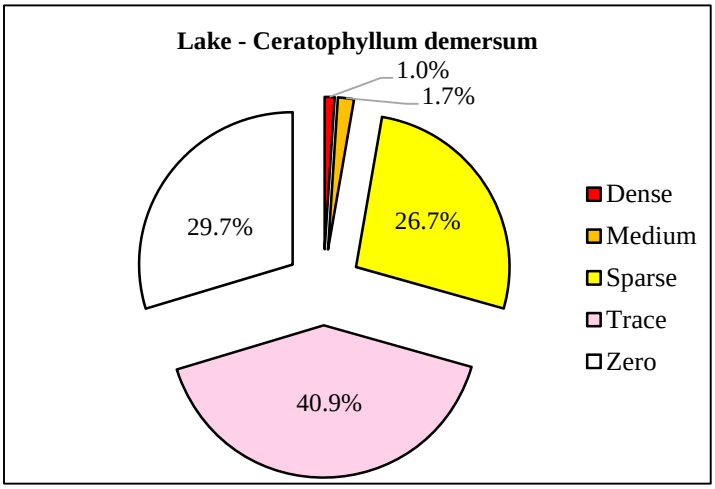
Map Fall Creek-25. Post-herbicide minor species found in Fall Creek as abundance by two rake-tosses in 2017.

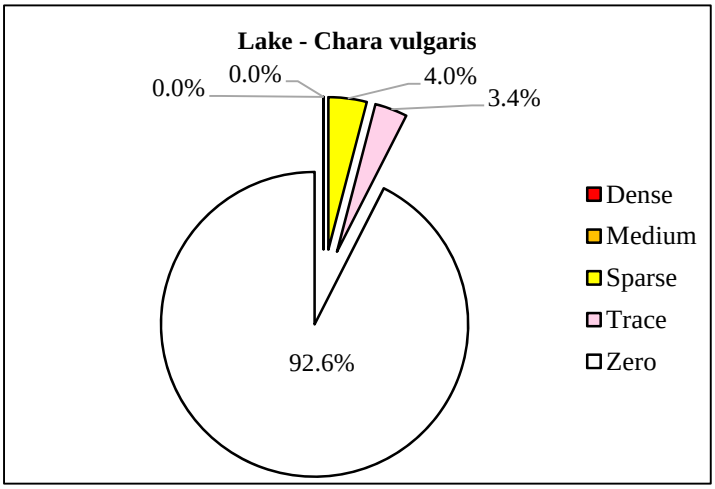




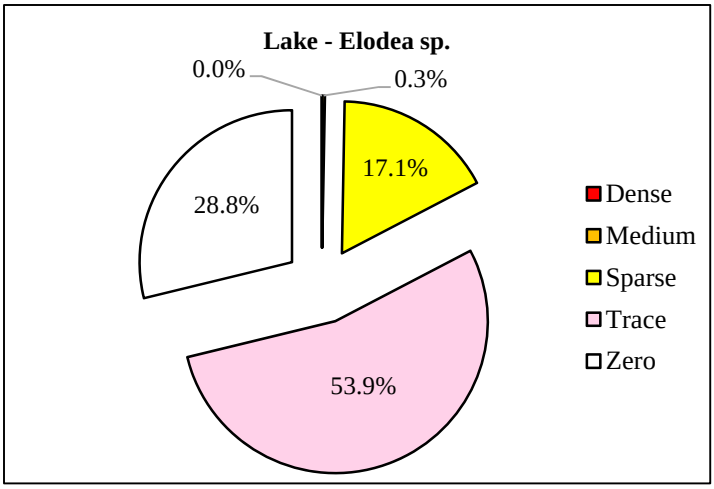


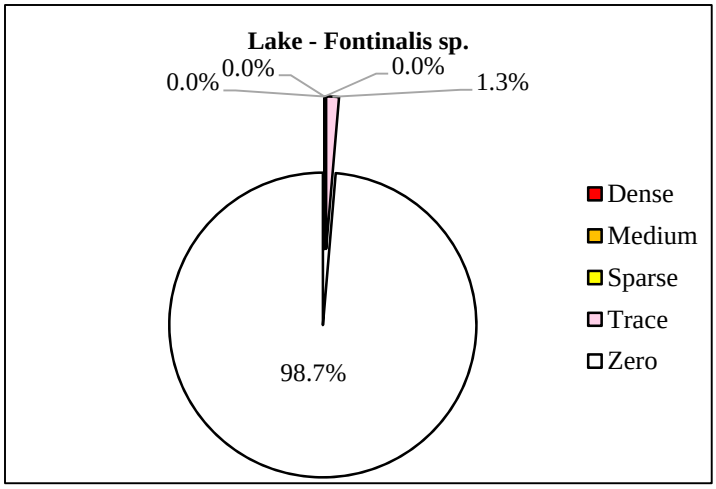


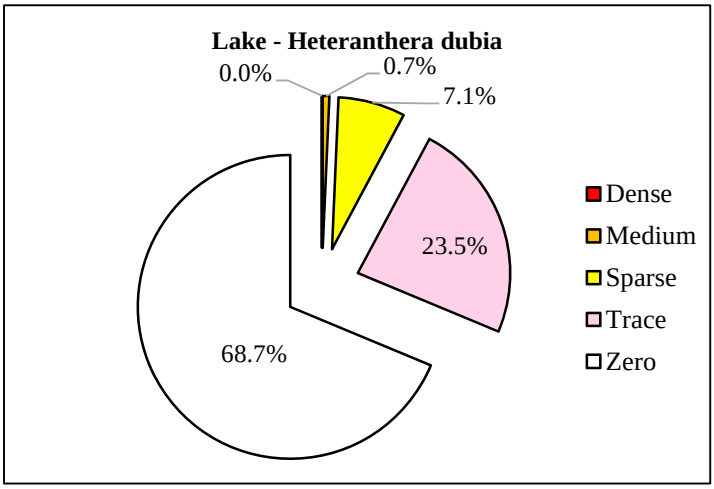


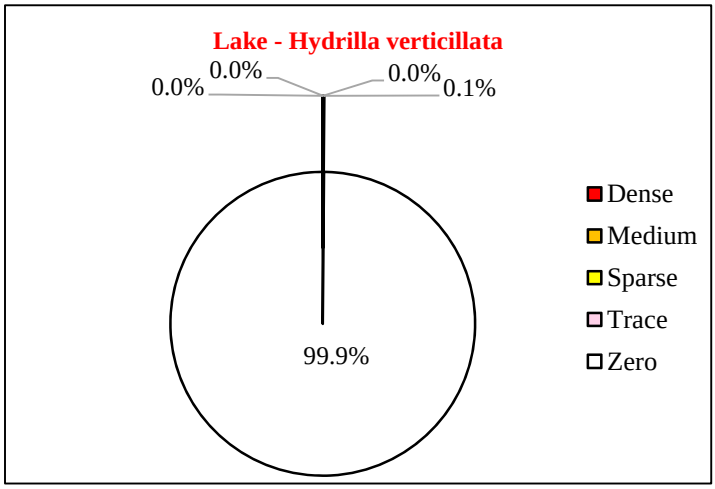


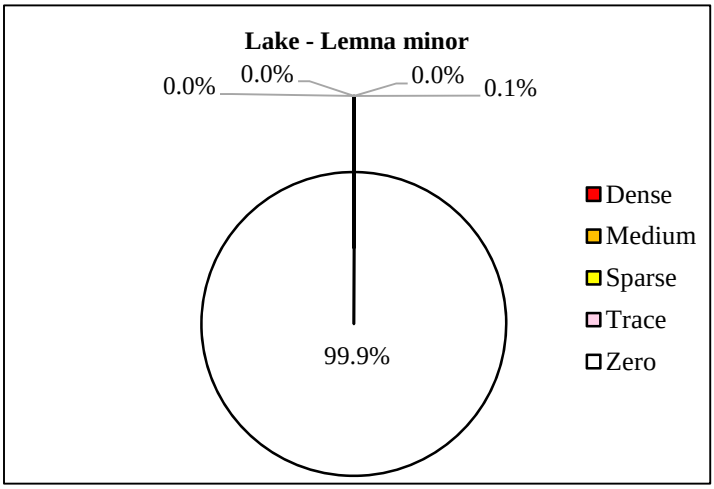
Lake-Pie 1. Percentages of each abundance category of the total 2,902 rake-tosses made in Cayuga Lake in 2017 for All species combined, Native species, Non-Native species, *Alisma gramineum*, *Ceratophyllum demersum* and *Chara vulgaris.*

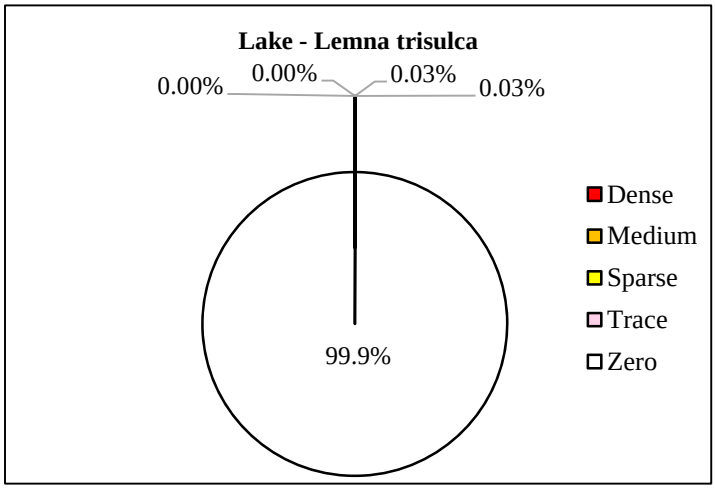




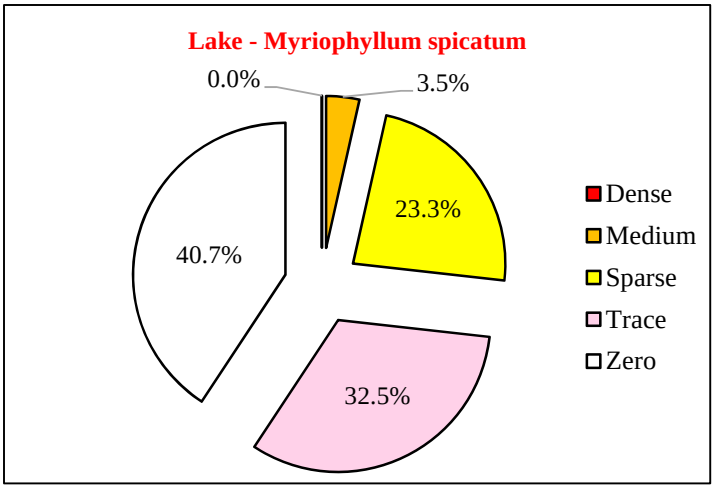


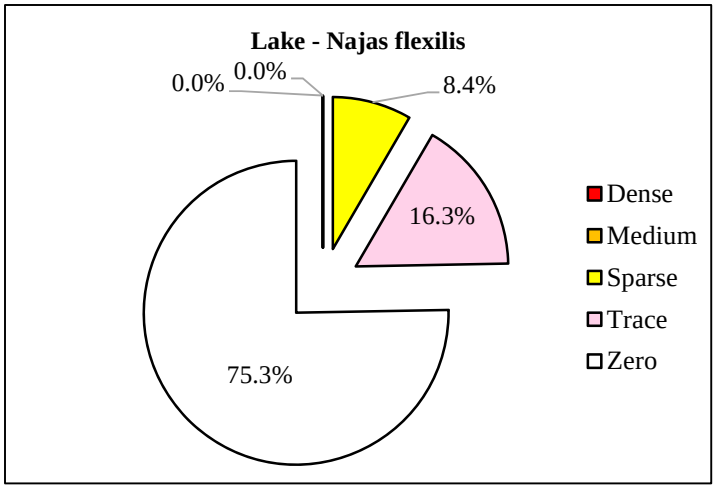


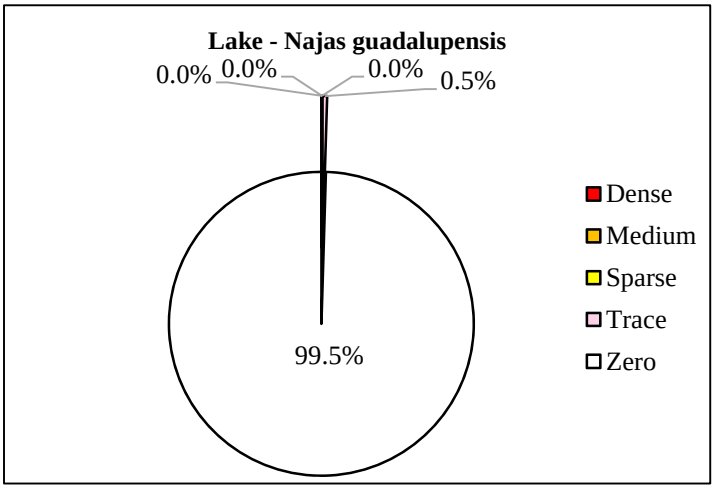


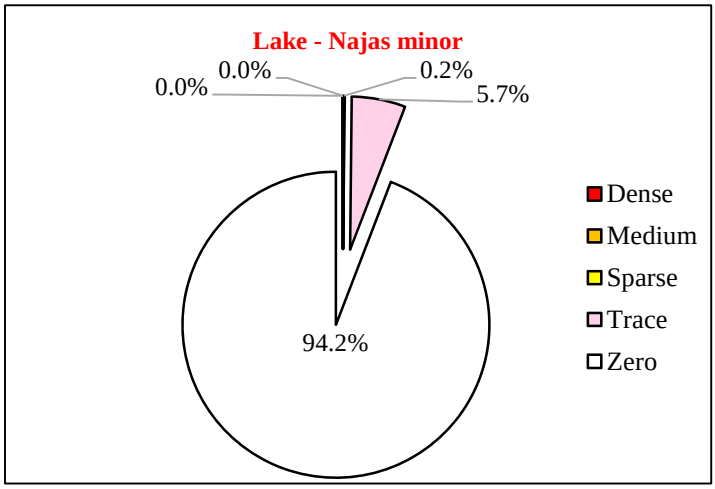


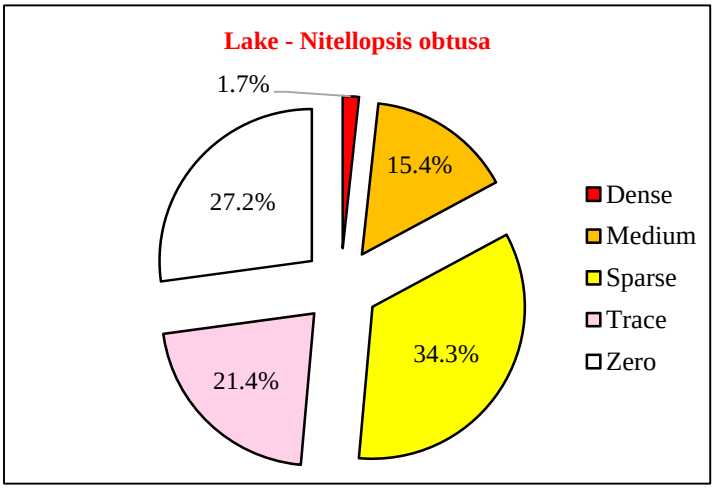
Lake-Pie 2. Percentages of each abundance category of the total 2,902 rake-tosses made in Cayuga Lake in 2017 for *Elodea sp.*, *Fontinalis sp.*, *Heteranthera dubia*, *Hydrilla verticillata*, *Lemna minor* and *Lemna trisulca.*

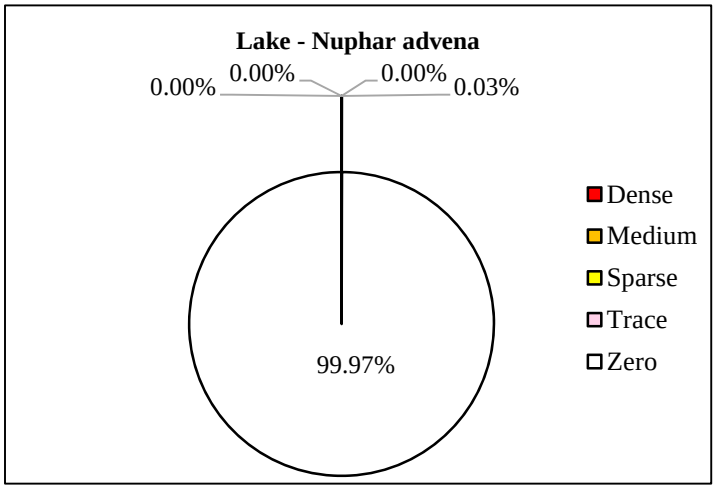




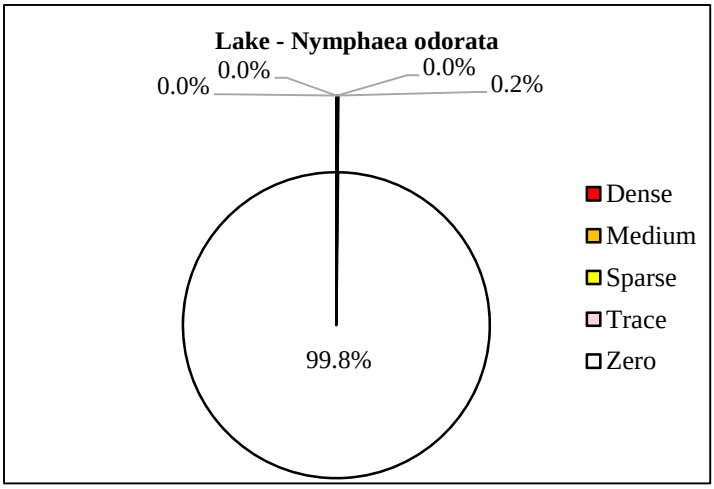


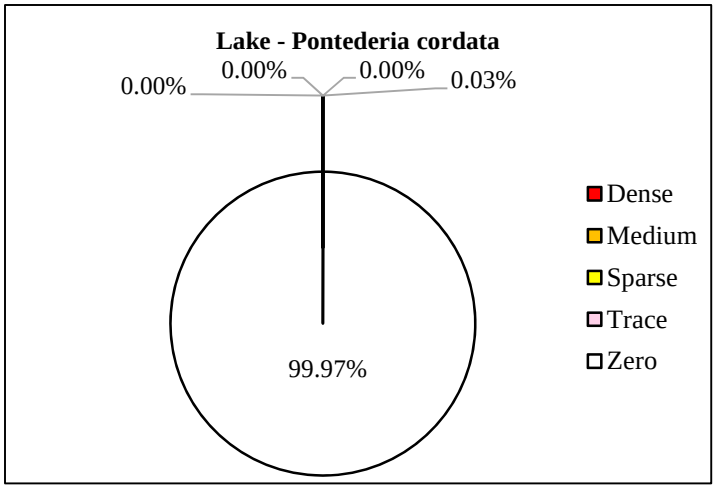


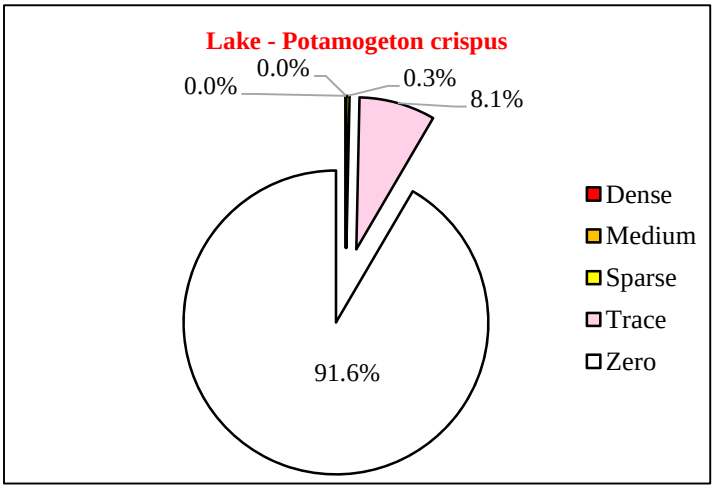


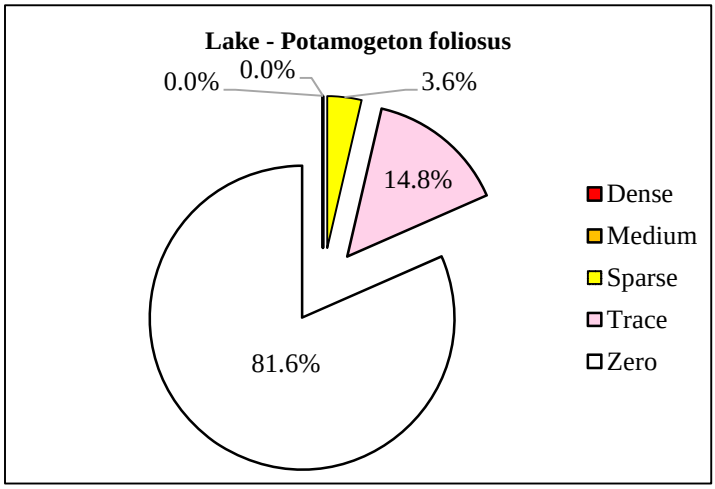


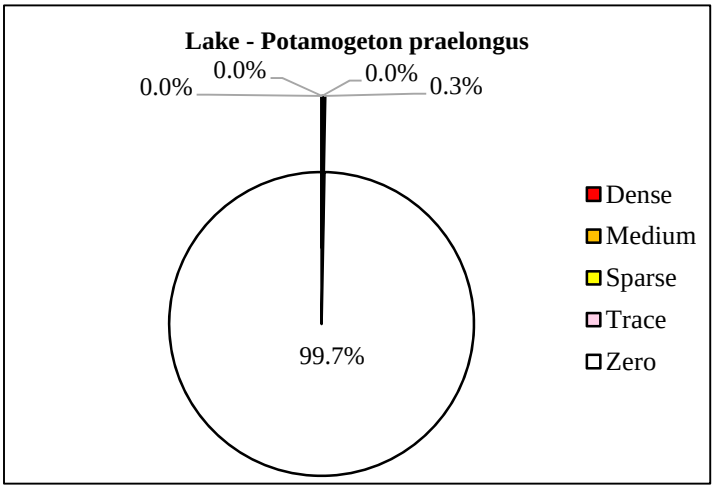
Lake-Pie 3. Percentages of each abundance category of the total 2,902 rake-tosses made in Cayuga Lake in 2017 for *Myriophyllum spicatum*, *Najas flexilis*, *Najas guadalupensis*, *Najas minor*, *Nitellopsis obtusa* and *Nuphar advena*.

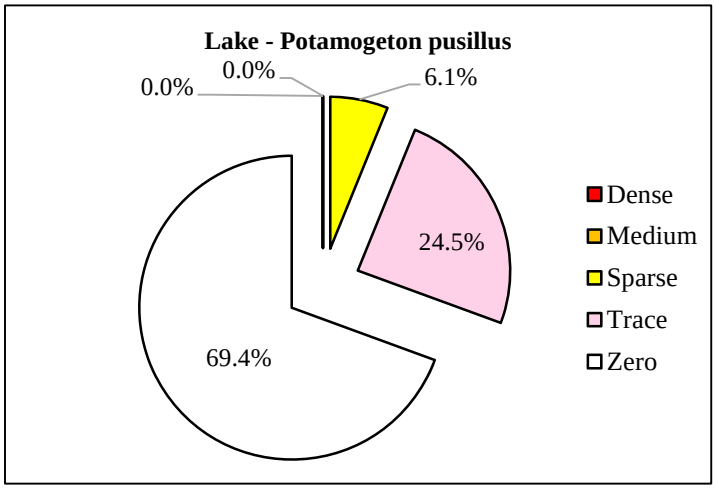




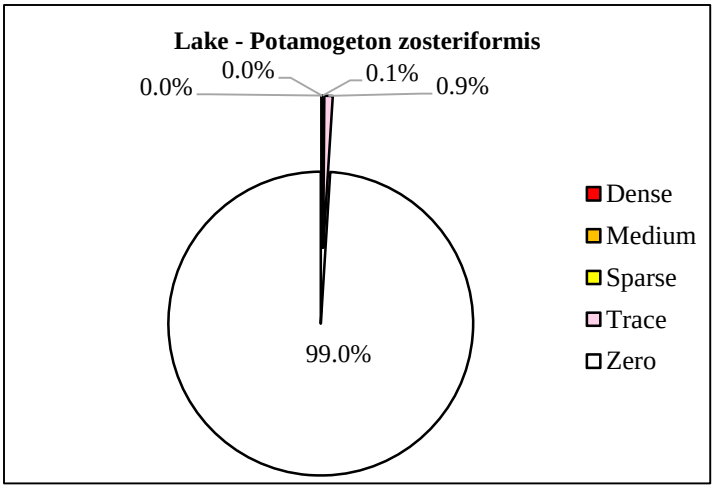


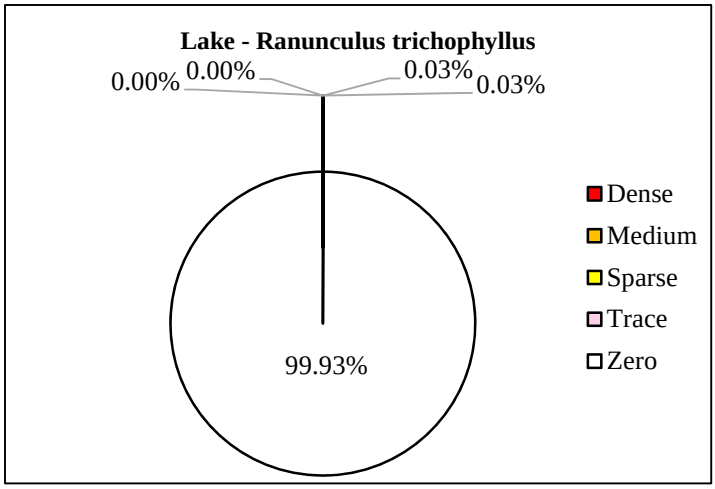


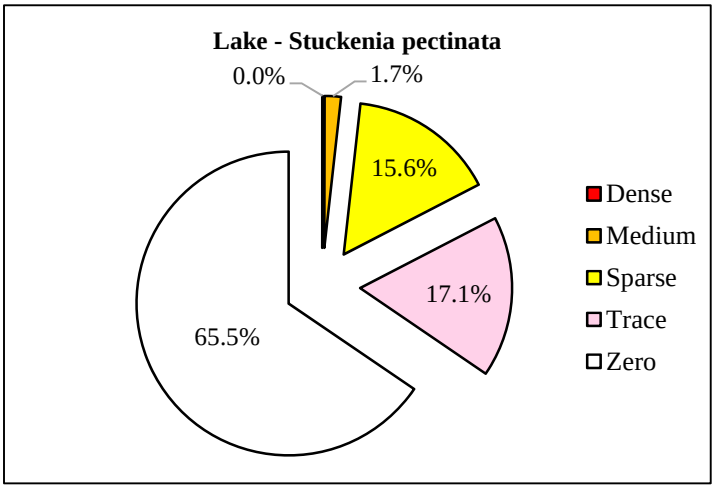


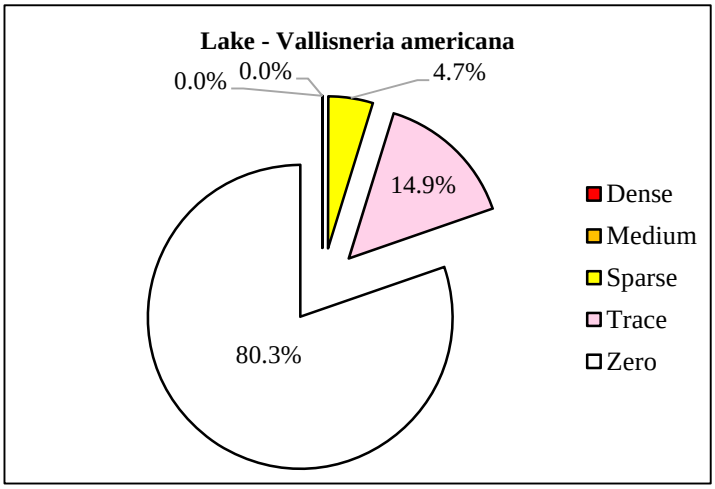


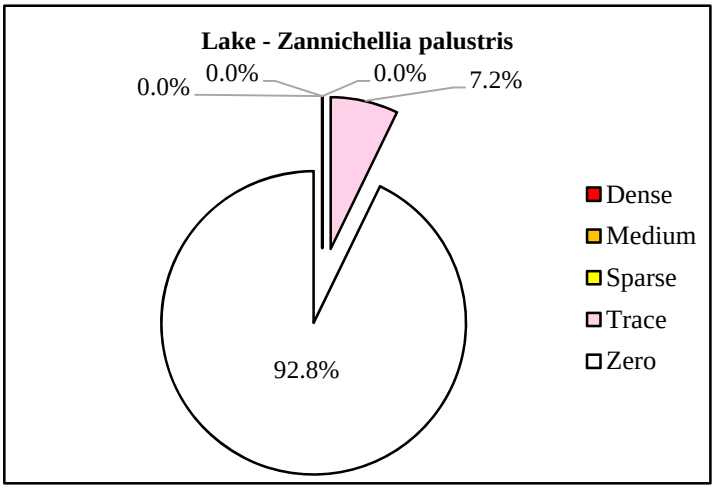
Lake-Pie 4. Percentages of each abundance category of the total 2,902 rake-tosses made in Cayuga Lake in 2017 for *Nymphaea odorata*, *Pontederia cordata*, *Potamogeton crispus*, *Potamogeton foliosus*, *Potamogeton praelongus* and *Potamogeton pusillus*.



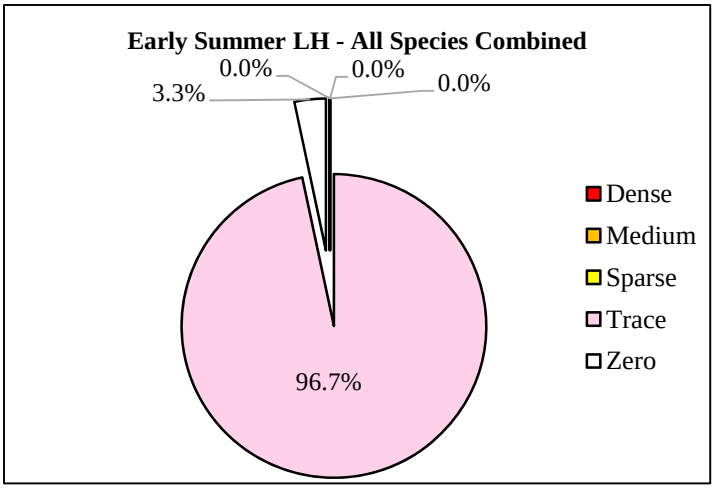


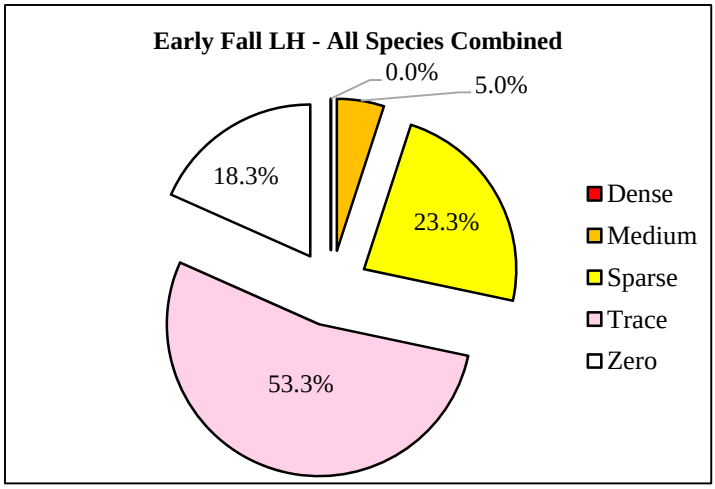


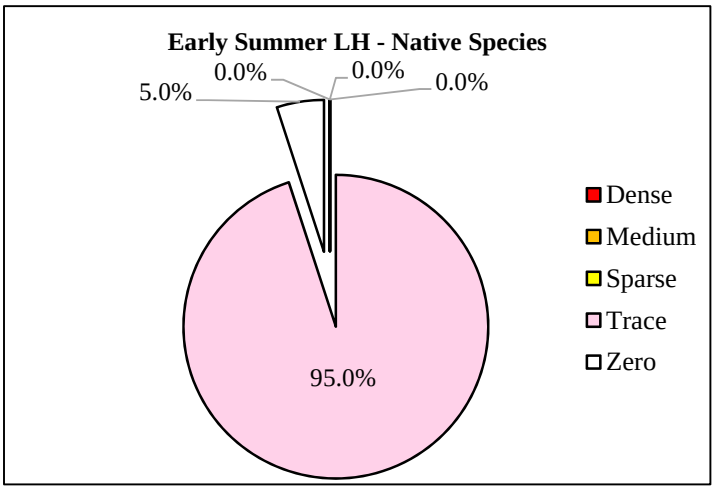


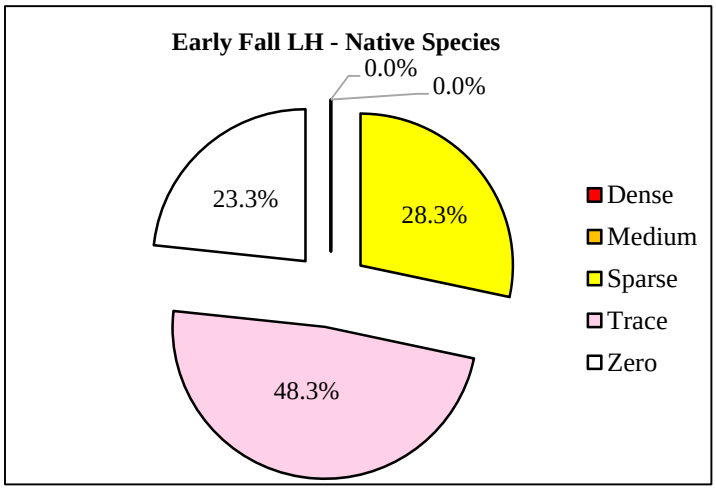


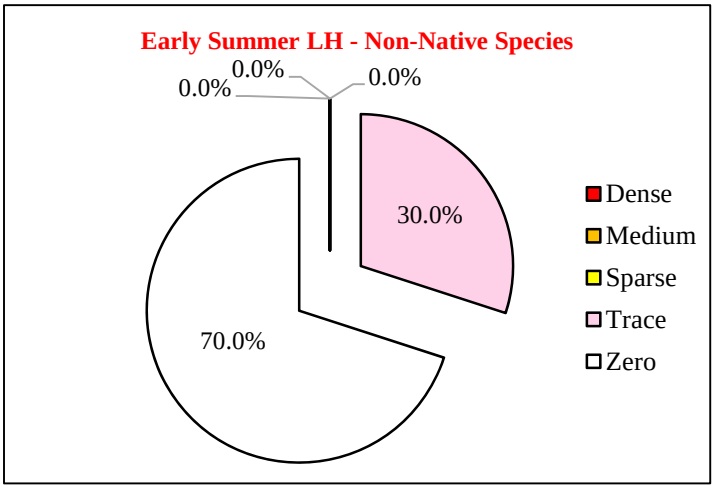
Lake-Pie 5. Percentages of each abundance category of the total 2,902 rake-tosses made in Cayuga Lake in 2017 for *Potamogeton zosteriformis*, *Ranunculus trichophyllus*, *Stuckenia pectinata*, *Vallisneria americana* and *Zannichellia palustris*.

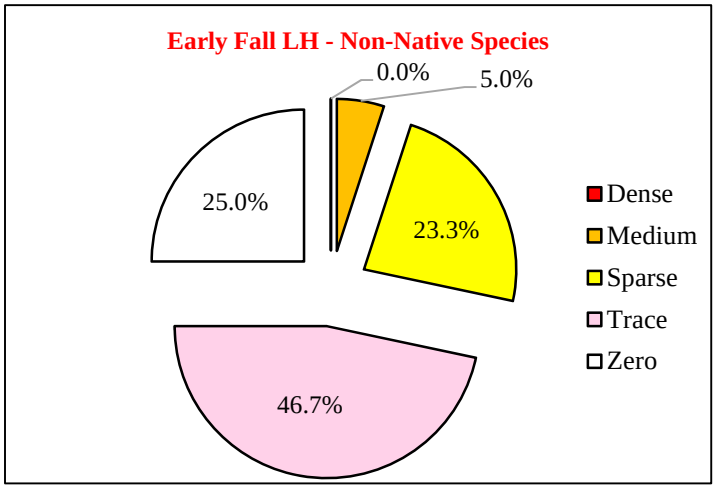




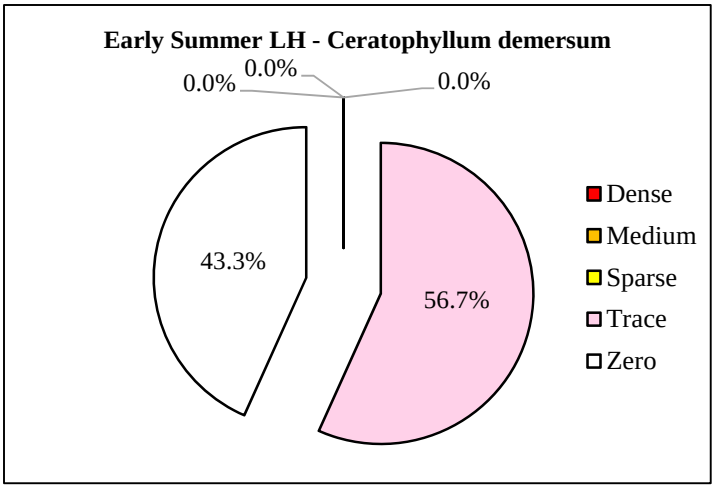


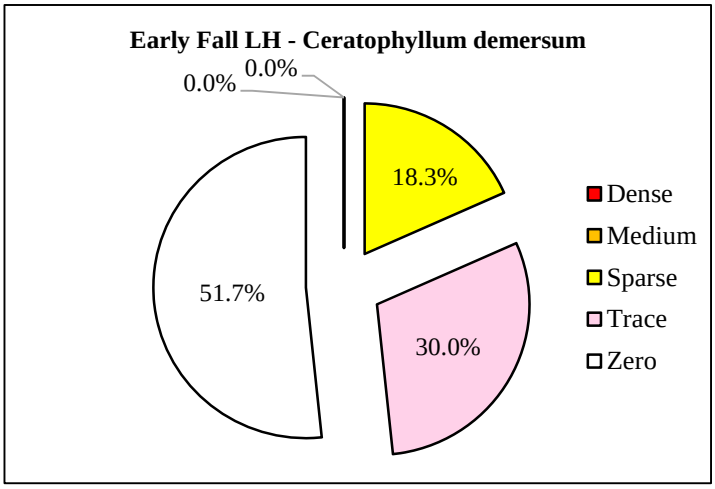


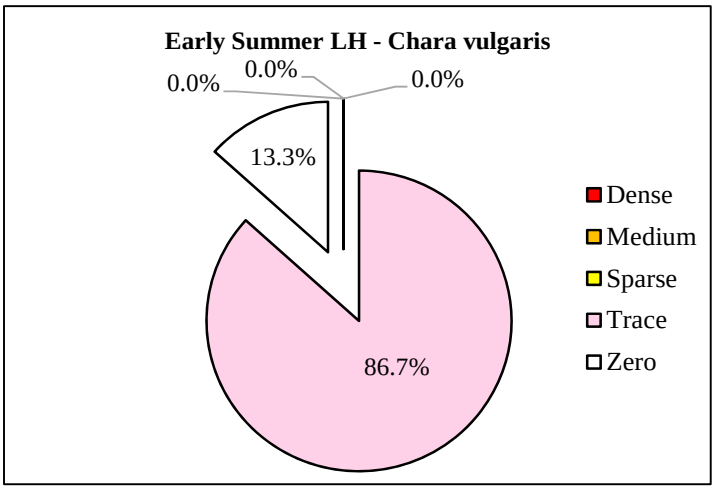


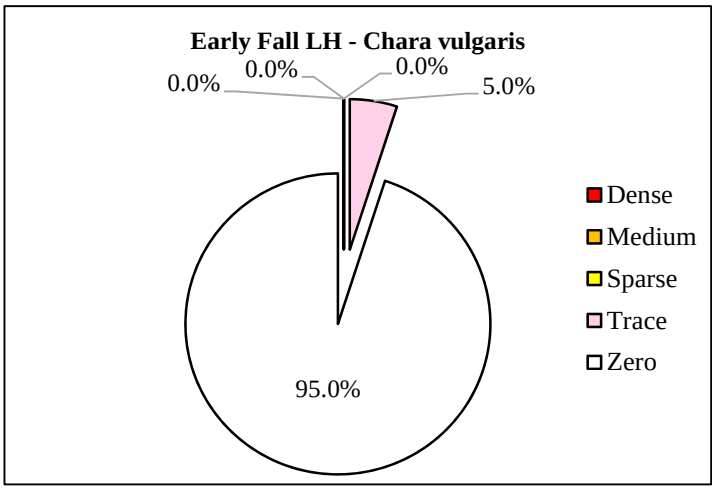


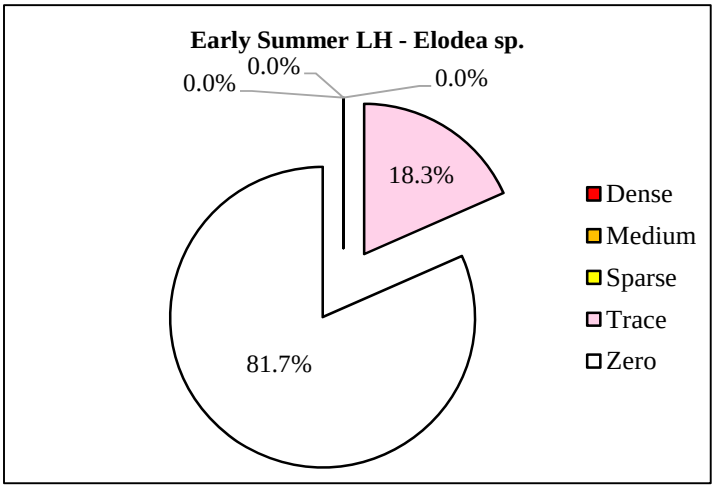
Lighthouse-Pie 1. Percentages of each abundance category of the total 60 rake-tosses (early summer and early fall) made in the Lighthouse Area of the Inlet in 2017 to contrast the early summer with the early fall values of each grouping of species for All species combined, Native species and Non-Native species.

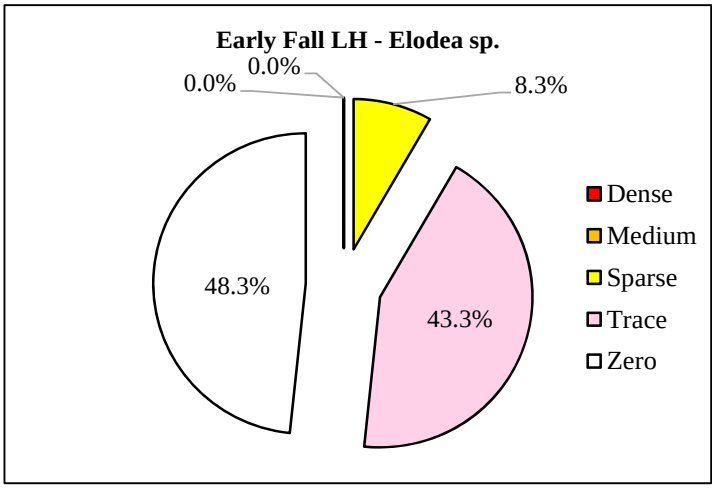




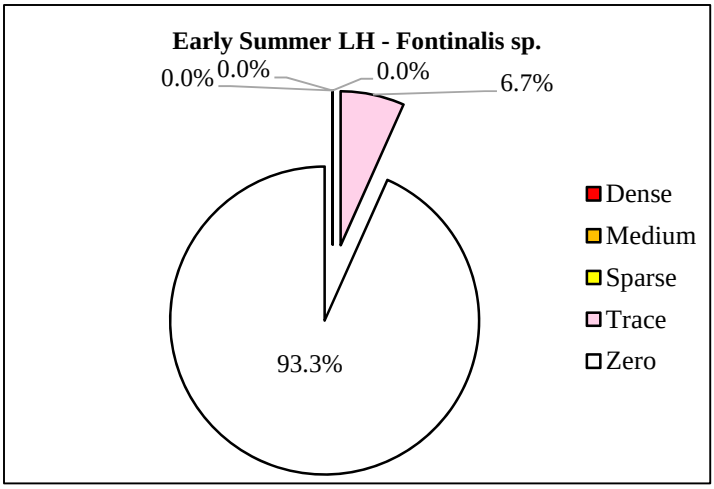


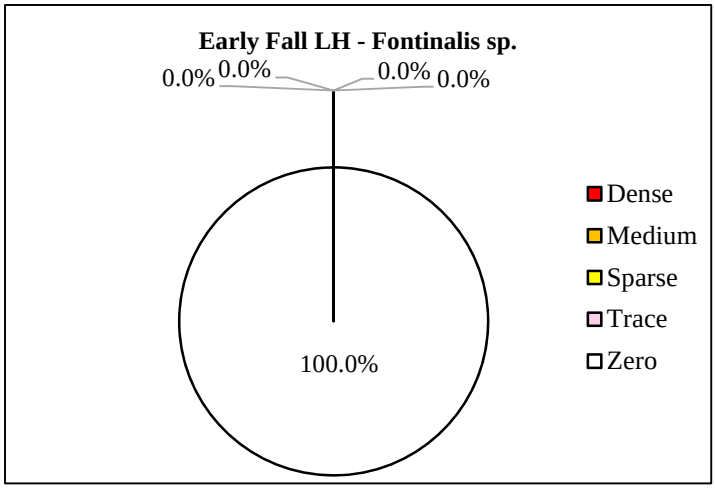


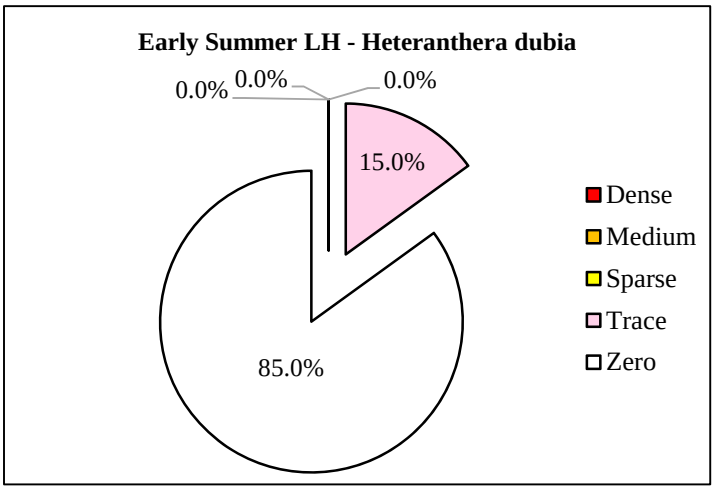


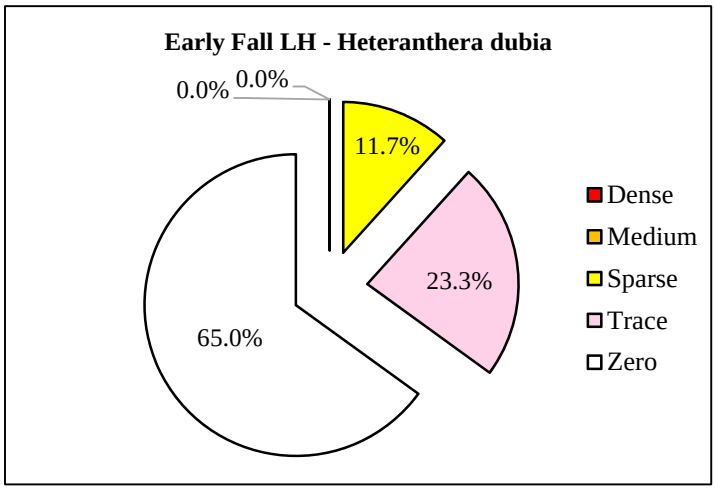


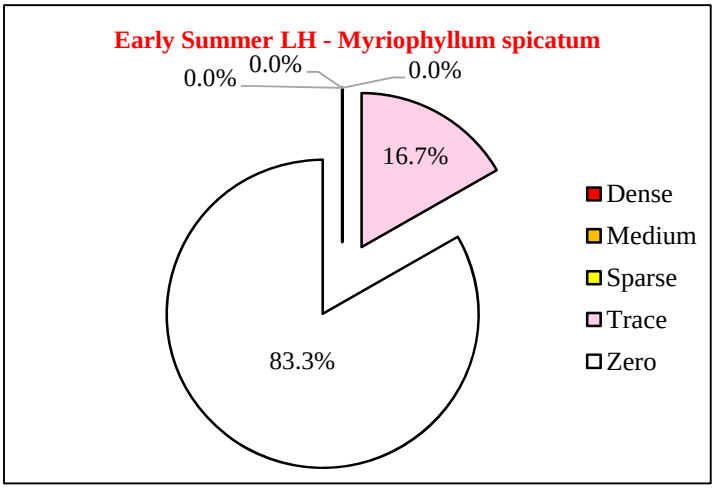
Lighthouse-Pie 2. Percentages of each abundance category of the total 60 rake-tosses (early summer and early fall) made in the Lighthouse Area of the Inlet in 2017 to contrast the early summer with the early fall values for *Ceratophyllum demersum*, *Chara vulgaris* and *Elodea sp.*

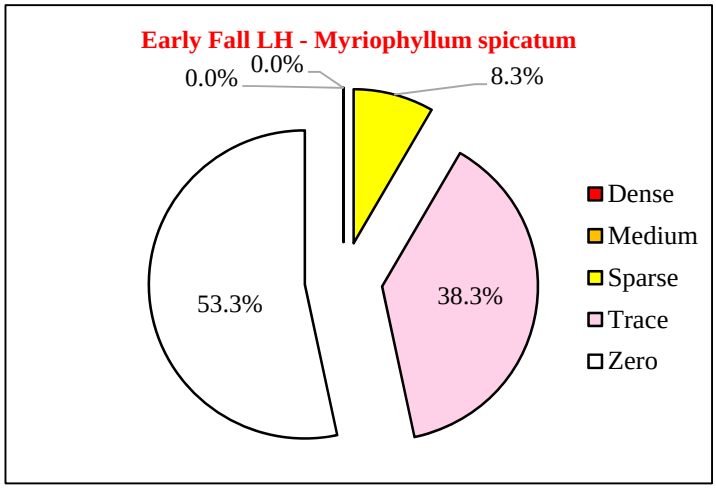




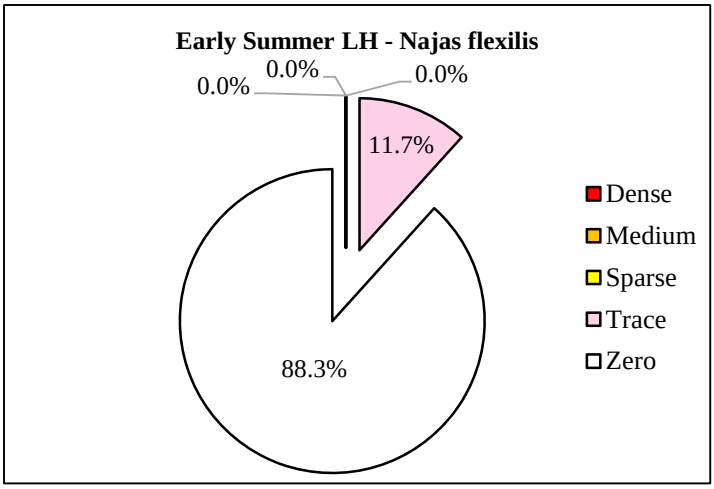


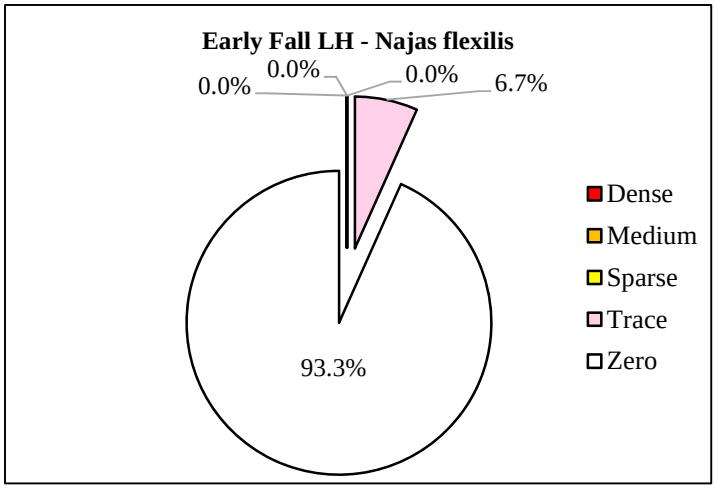


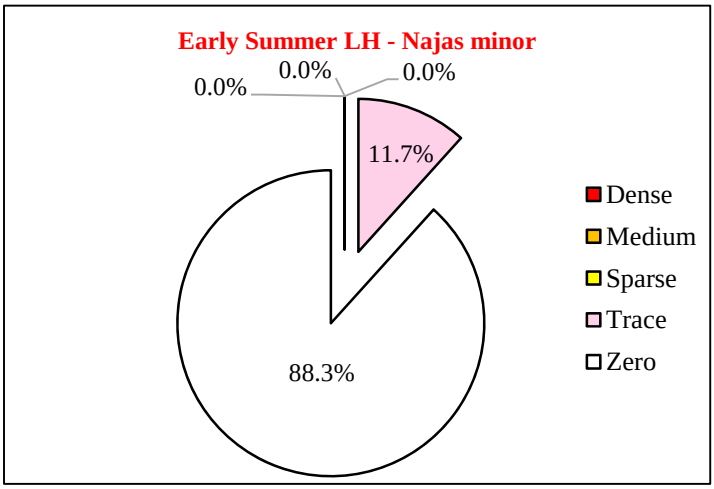


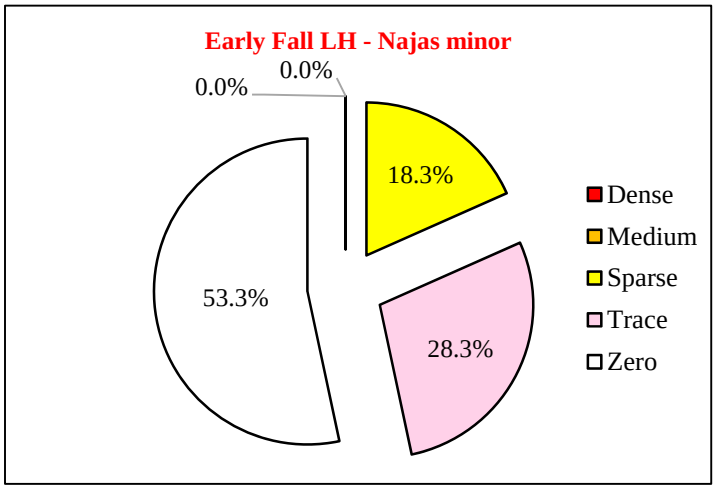


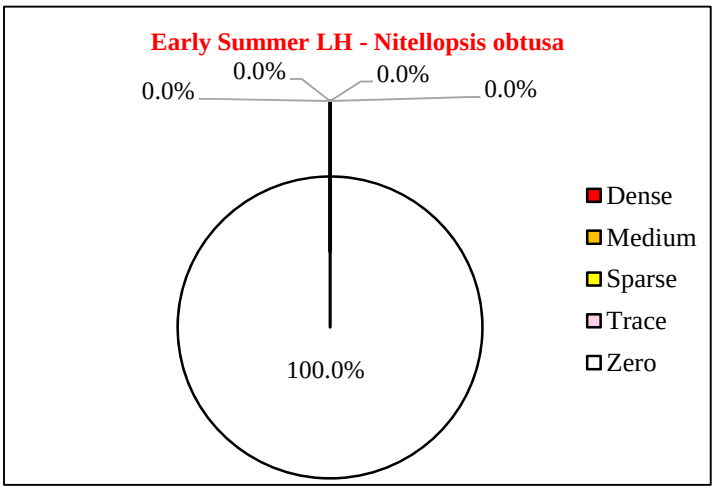
Lighthouse-Pie 3. Percentages of each abundance category of the total 60 rake-tosses (early summer and early fall) made in the Lighthouse Area of the Inlet in 2017 to contrast the early summer with the early fall values for *Fontinalis sp.*, *Heteranthera dubia* and *Myriophyllum spicatum*.

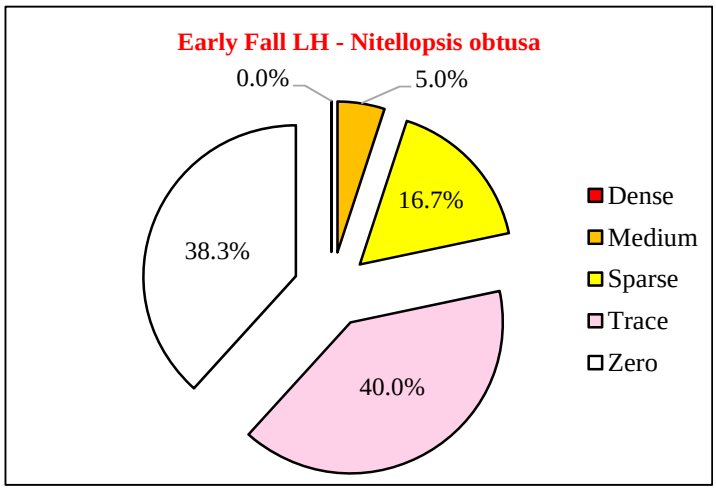




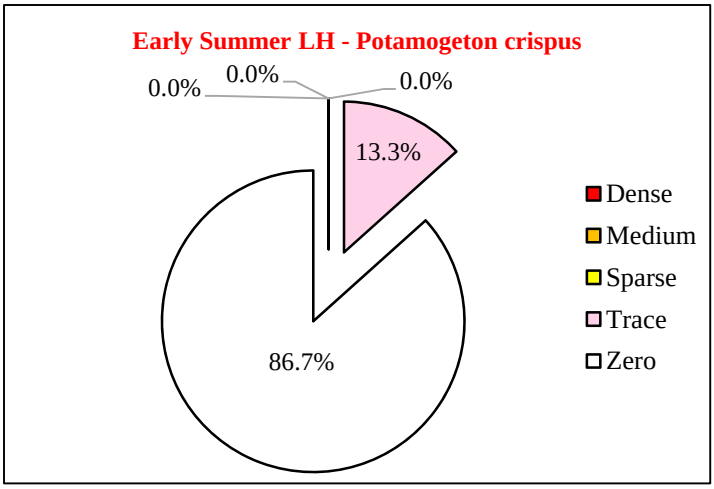


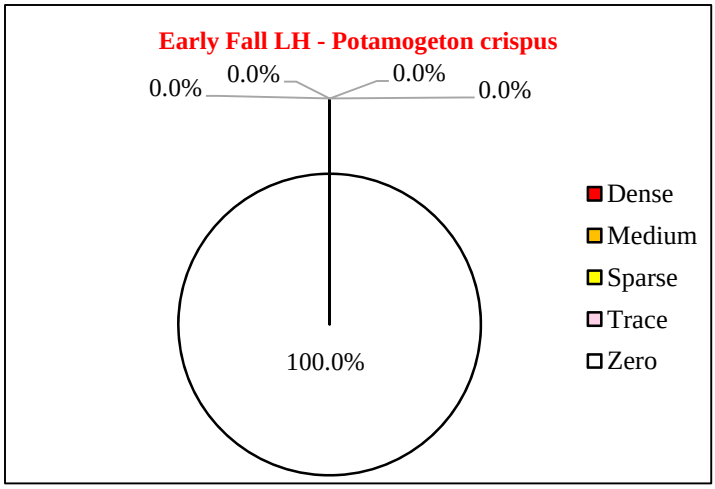


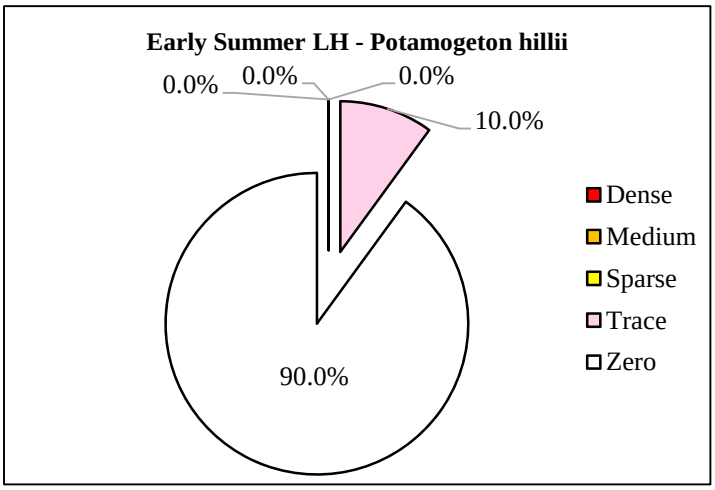


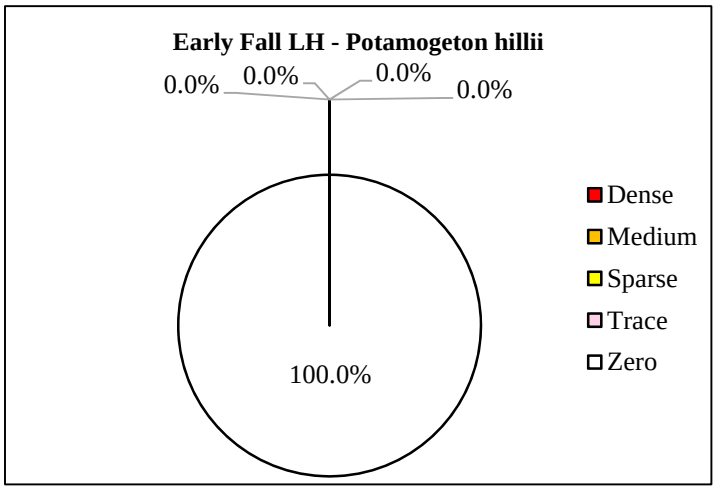


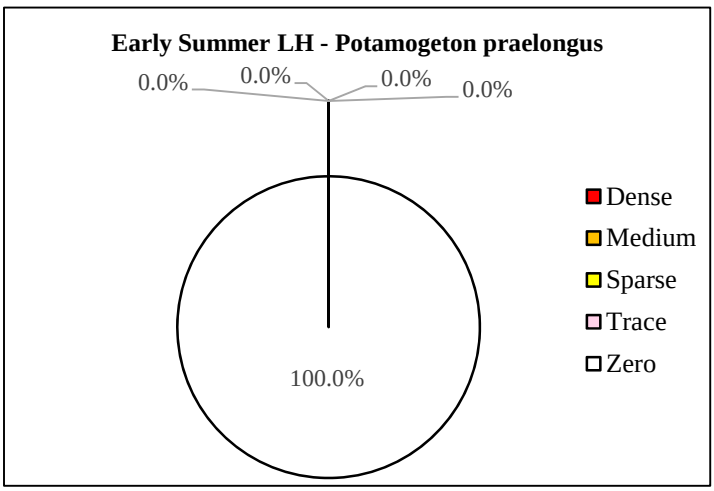
Lighthouse-Pie 4. Percentages of each abundance category of the total 60 rake-tosses (early summer and early fall) made in the Lighthouse Area of the Inlet in 2017 to contrast the early summer with the early fall values for *Najas flexilis*, *Najas minor* and *Nitellopsis obtusa*.

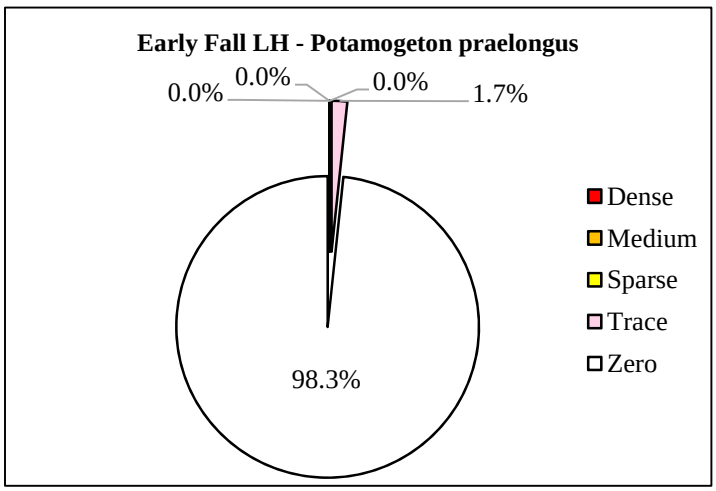




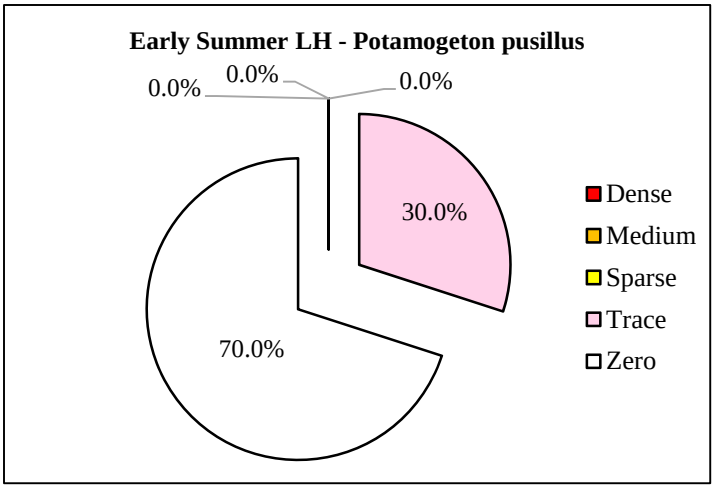


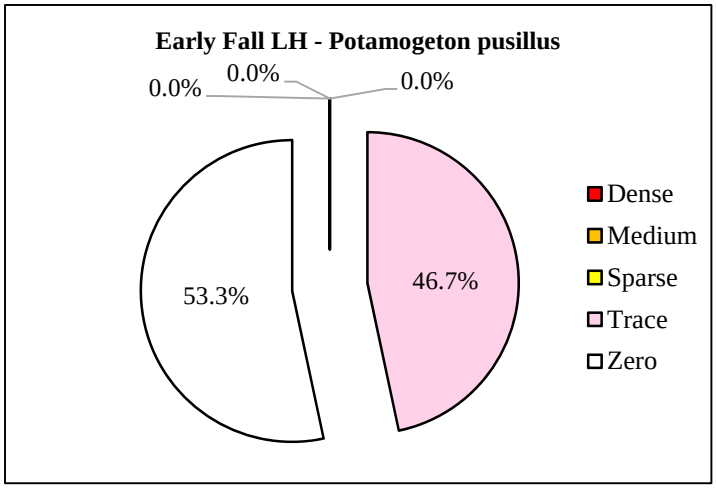


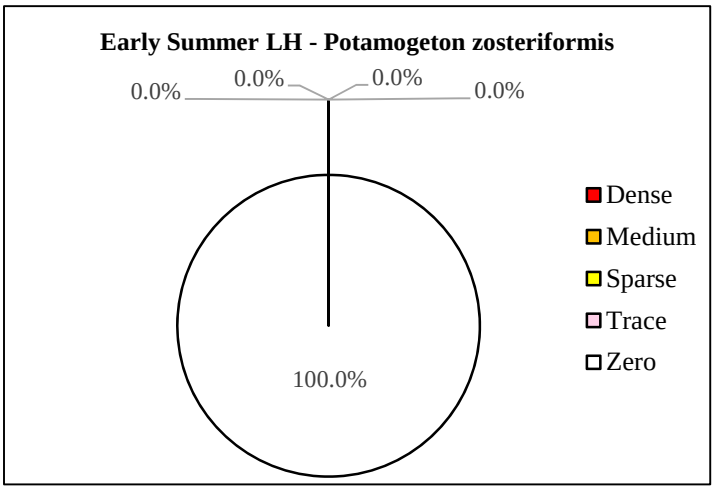


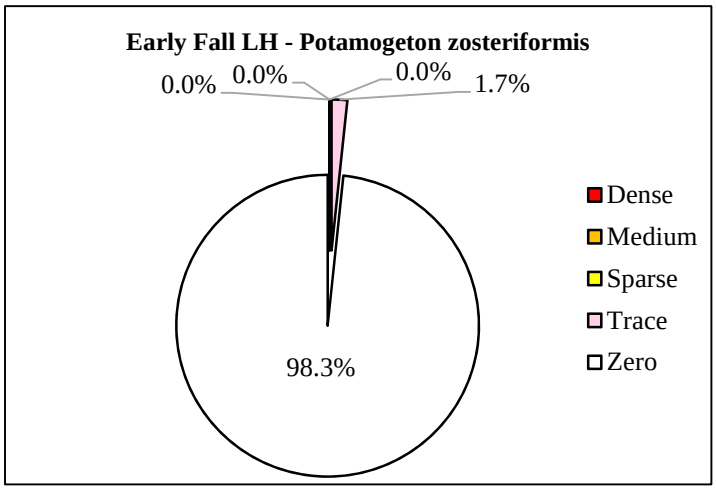


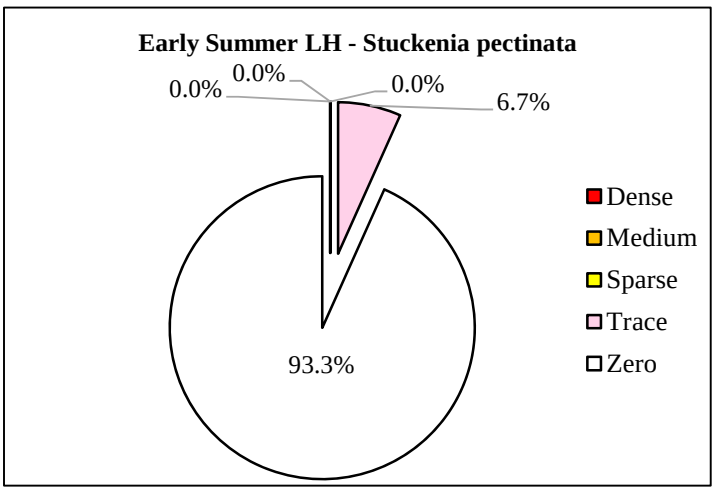
Lighthouse-Pie 5. Percentages of each abundance category of the total 60 rake-tosses (early summer and early fall) made in the Lighthouse Area of the Inlet in 2017 to contrast the early summer with the early fall values for *Potamogeton crispus*, *Potamogeton hillii* and *Potamogeton praelongus.*

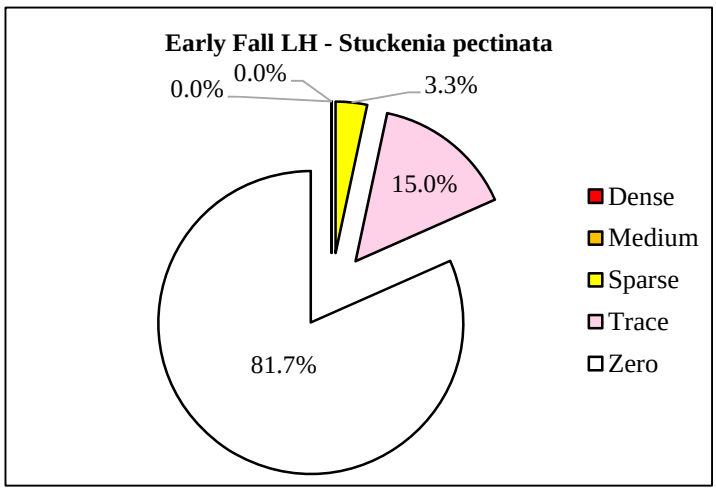




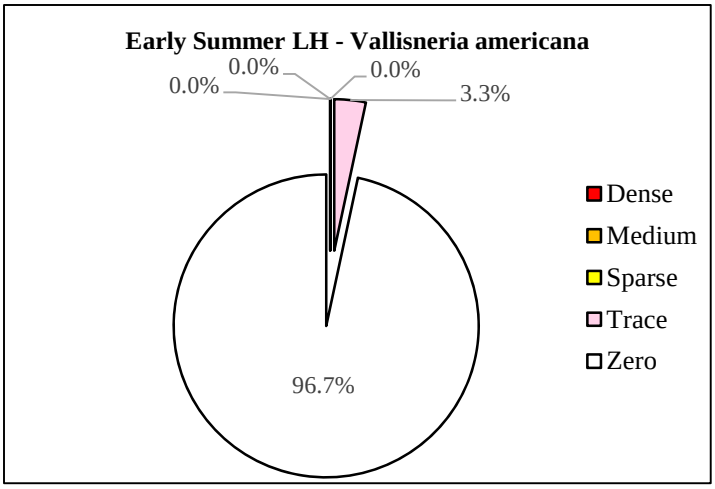


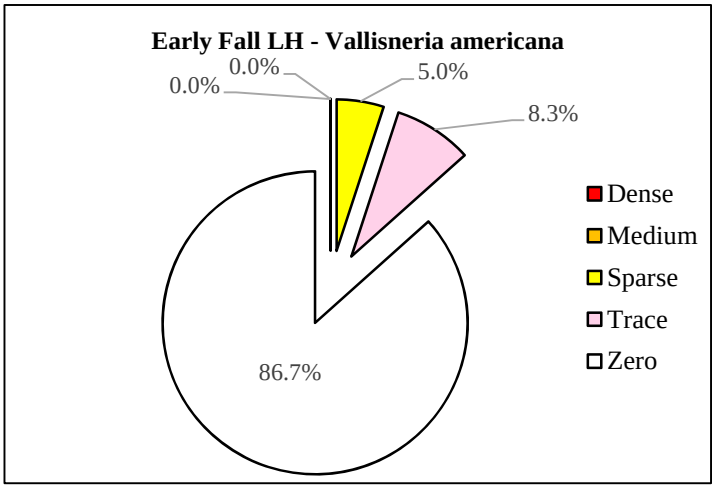


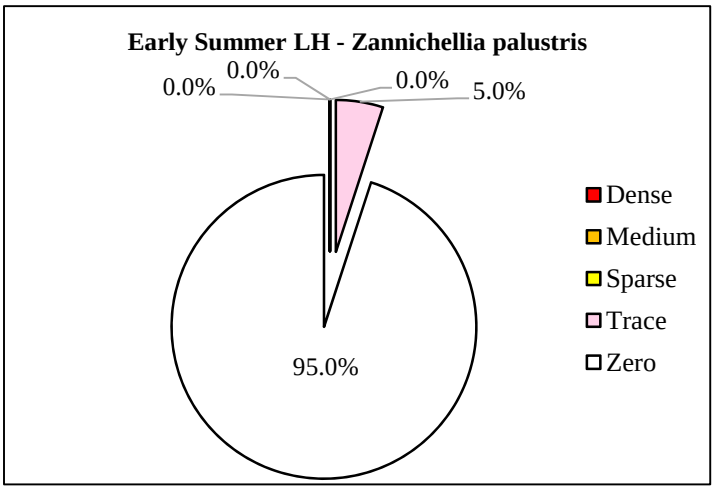


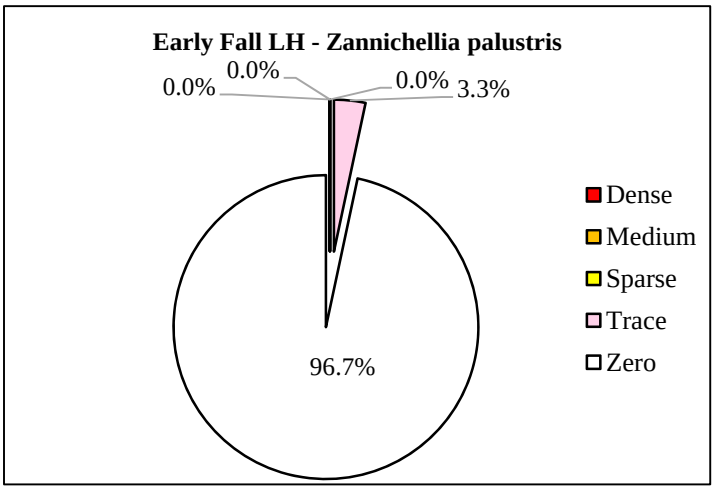


Lighthouse-Pie 6. Percentages of each abundance category of the total 60 rake-tosses (early summer and early fall) made in the Lighthouse Area of the Inlet in 2017 to contrast the early summer with the early fall values for *Potamogeton pusillus*, *Potamogeton zosteriformis* and *Stuckenia pectinata.*

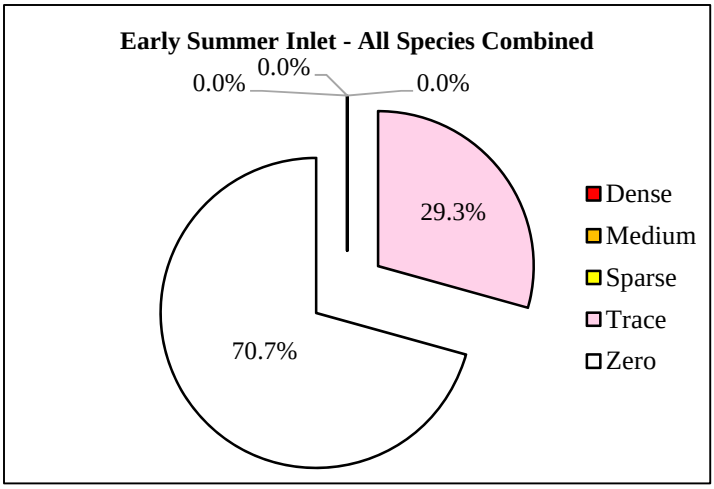


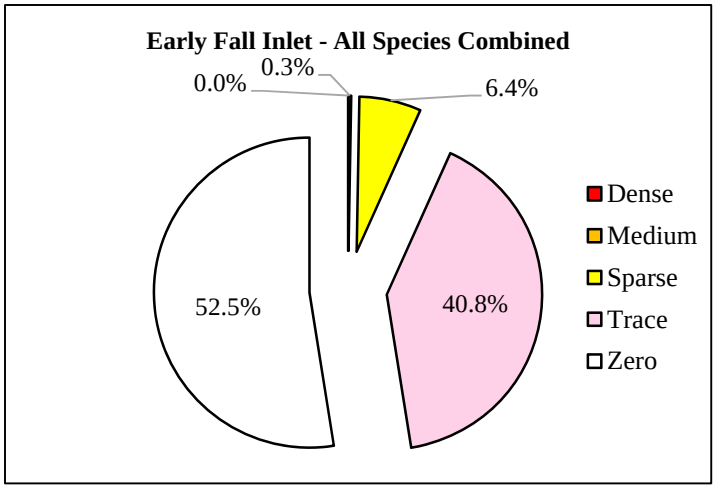


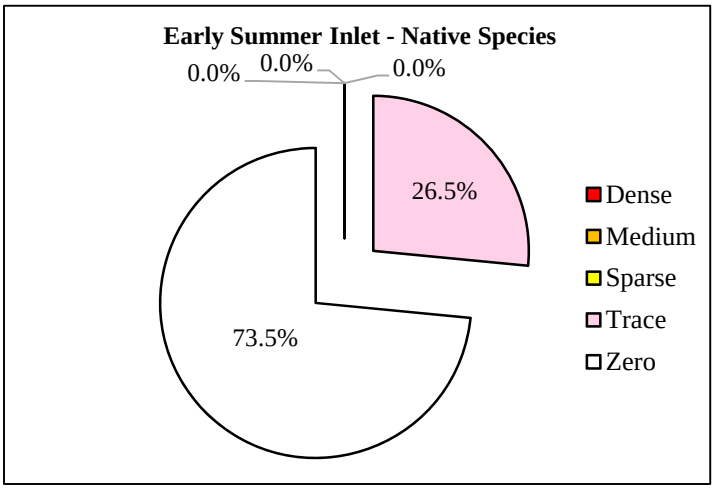


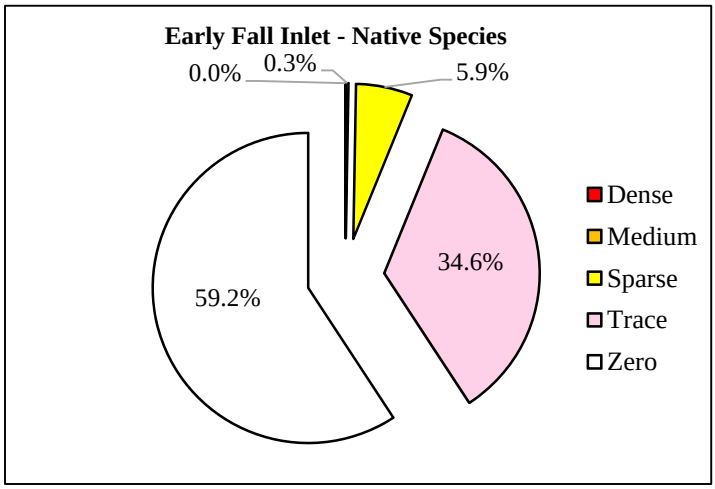


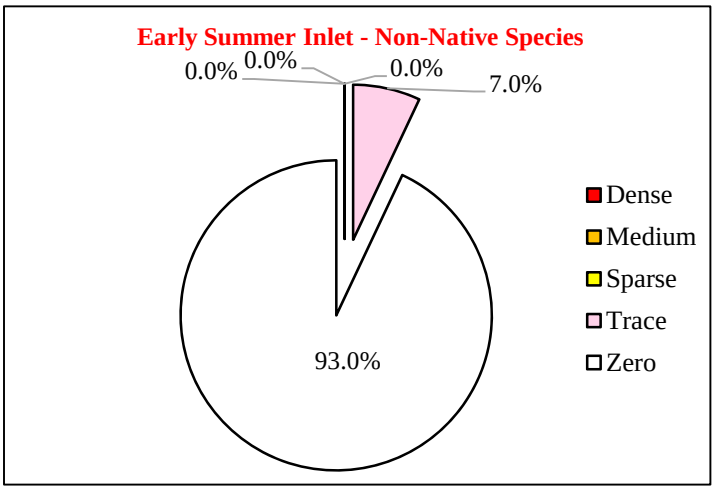
Lighthouse-Pie 7. Percentages of each abundance category of the total 60 rake-tosses (early summer and early fall) made in the Lighthouse Area of the Inlet in 2017 to contrast the early summer with the early fall values for *Vallisneria americana* and *Zannichellia palustris.*

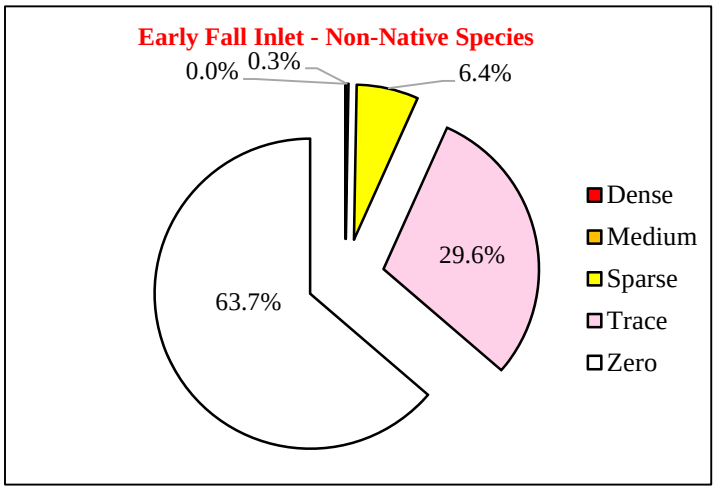




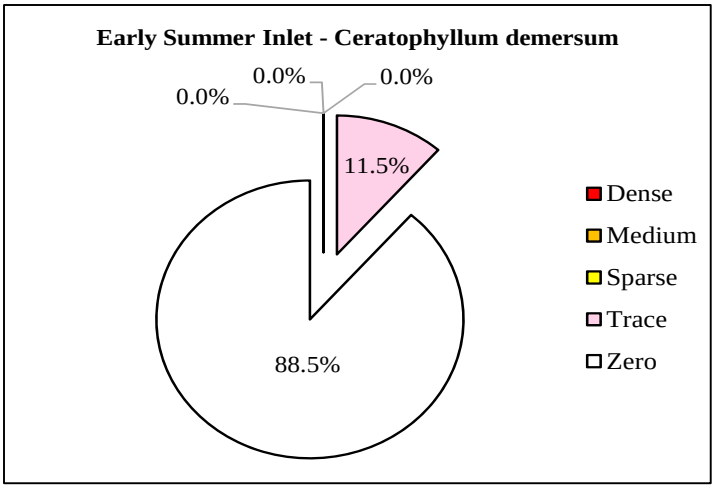


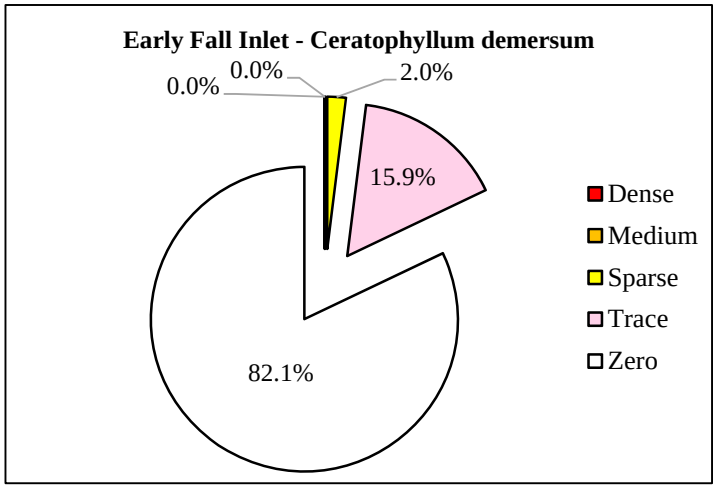


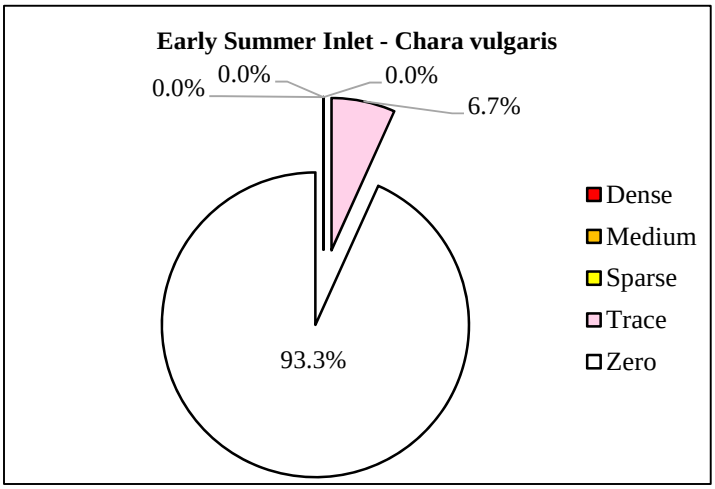


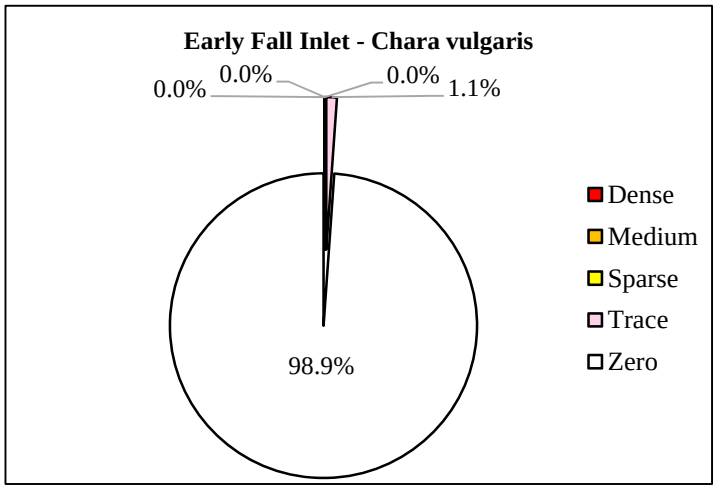


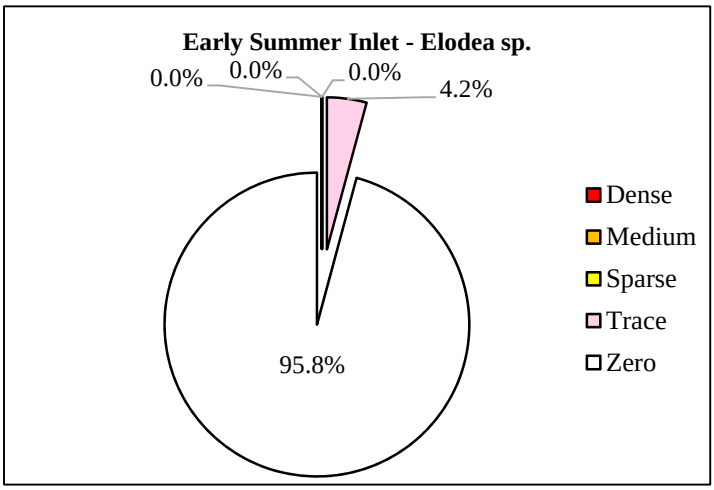
Inlet proper-Pie 1. Percentages of each abundance category of the total 358 rake-tosses (early summer and early fall) made in the Inlet proper in 2017 to contrast the early summer with the early fall values of each species' grouping for All species combined, Native species and Non-Native species.

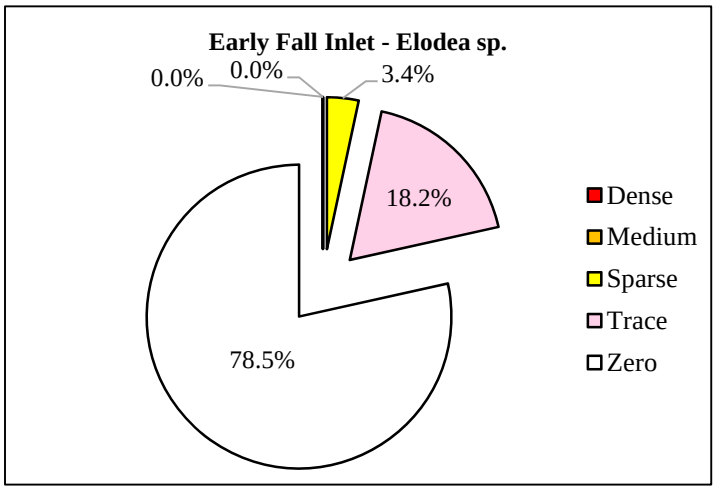




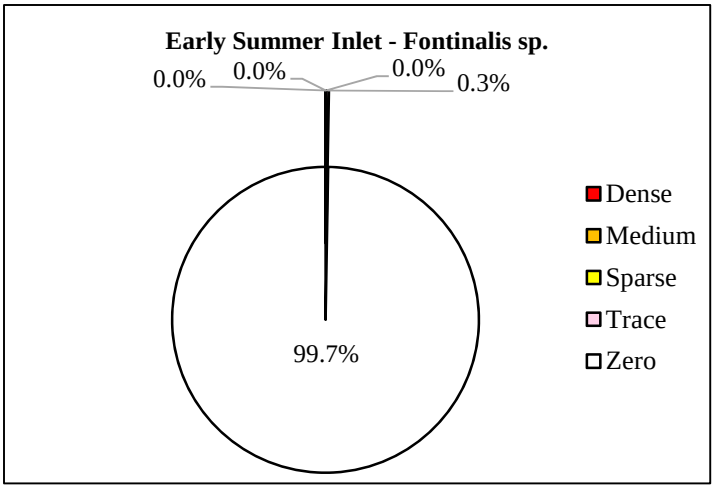


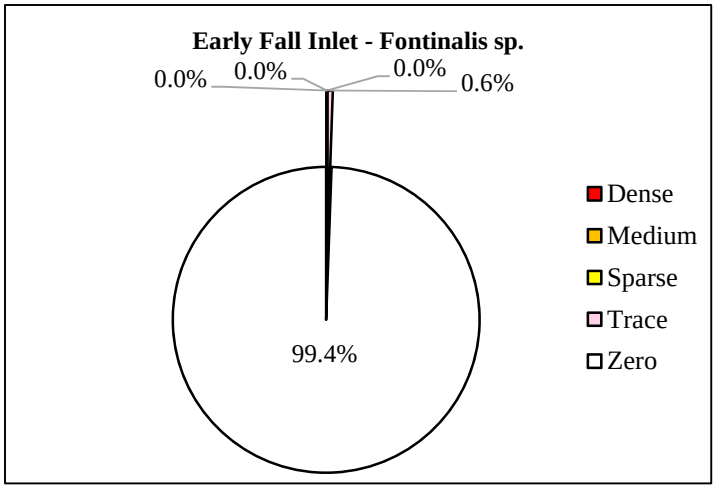


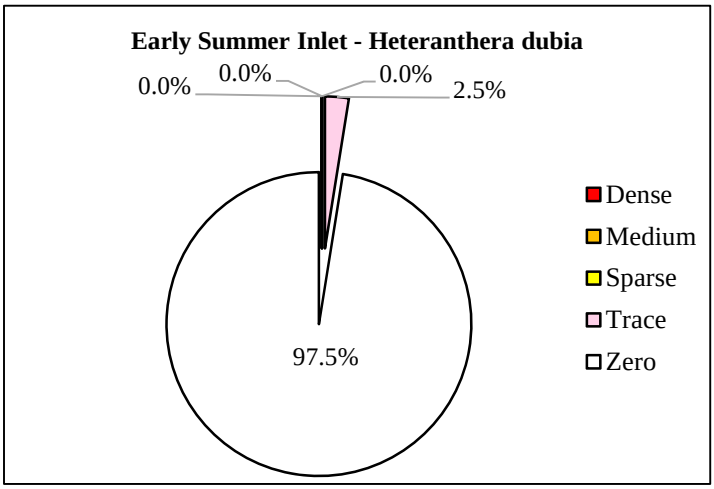


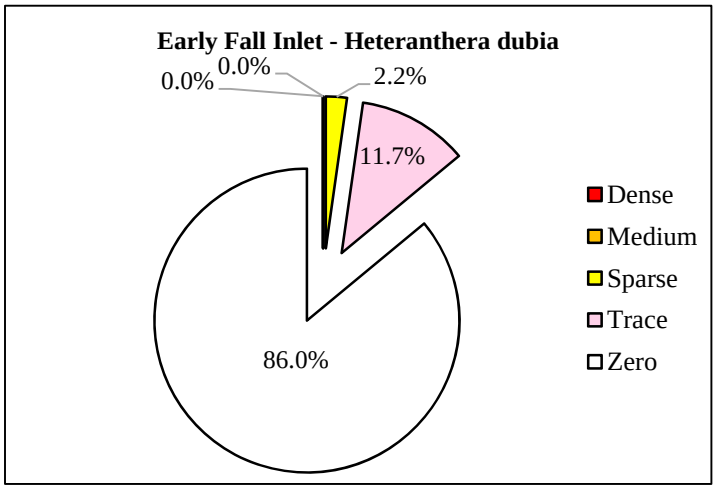


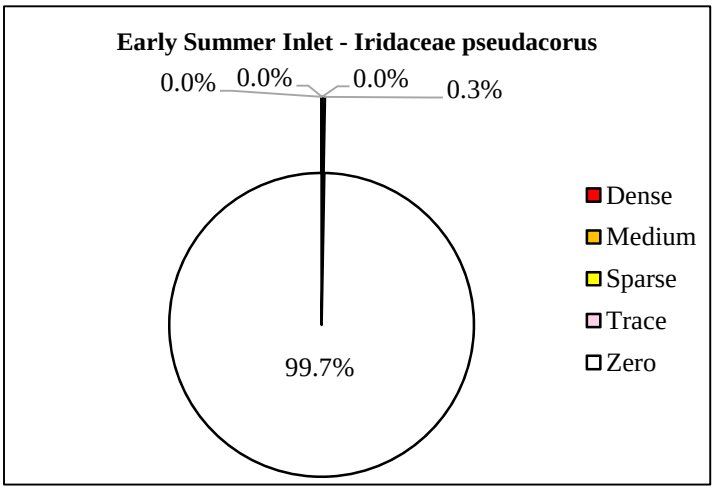
Inlet proper-Pie 2. Percentages of each abundance category of the total 358 rake-tosses (early summer and early fall) made in the Inlet proper in 2017 to contrast the early summer with the early fall values for *Ceratophyllum demersum*, *Chara vulgaris* and *Elodea sp*.

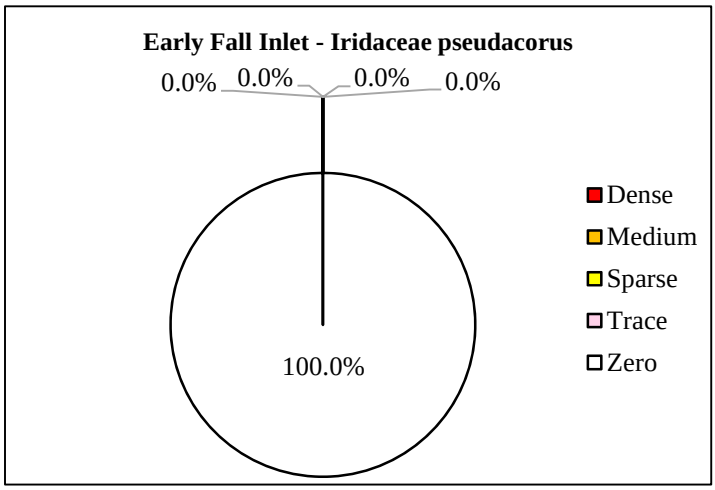




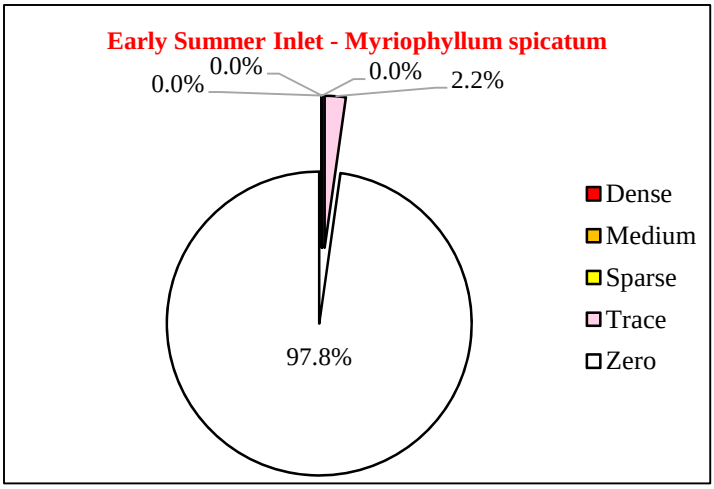


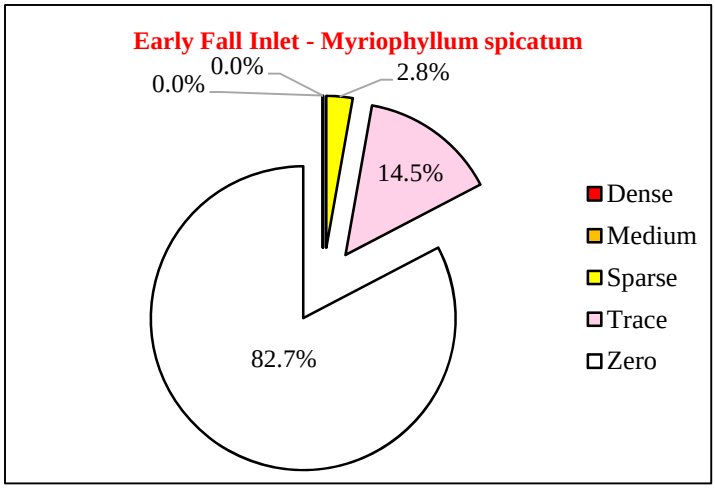


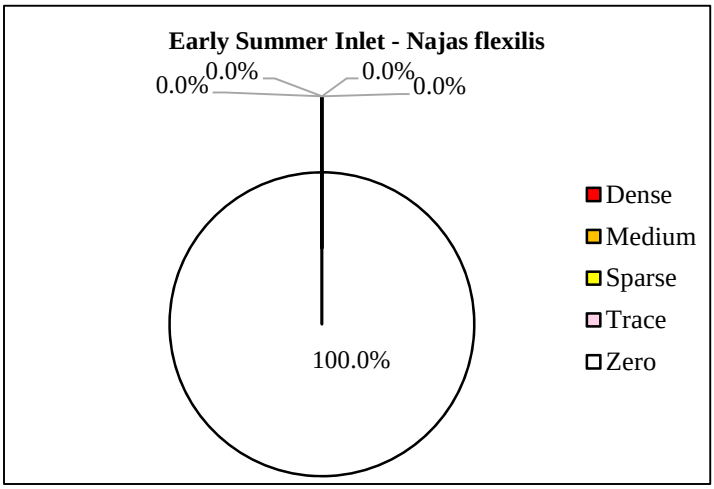


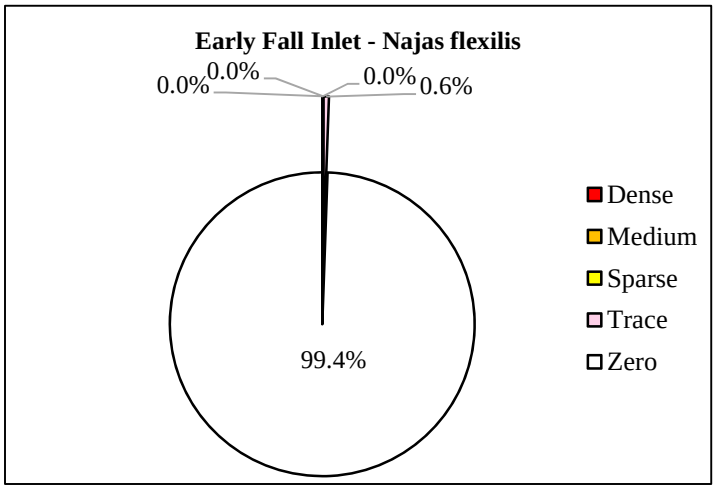


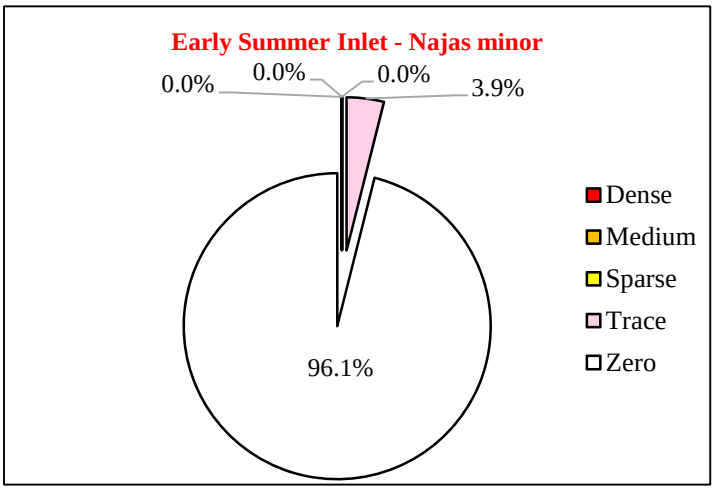
Inlet proper-Pie 3. Percentages of each abundance category of the total 358 rake-tosses (early summer and early fall) made in the Inlet proper in 2017 to contrast the early summer with the early fall values for *Fontinalis sp.*, *Heteranthera dubia* and *Iridaceae pseudoacorus*.

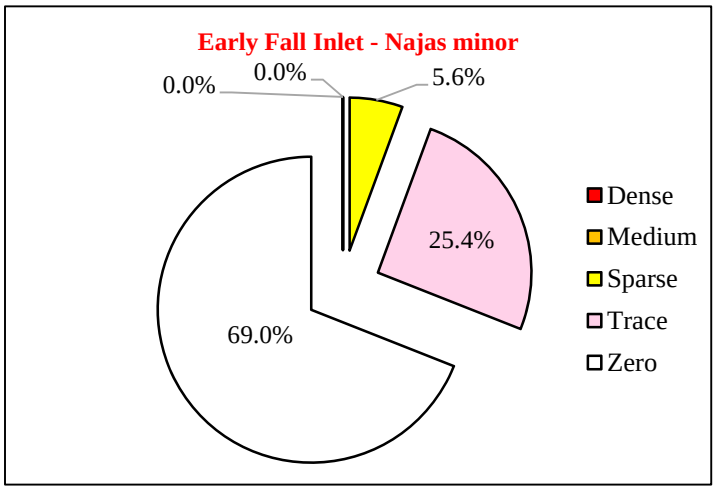




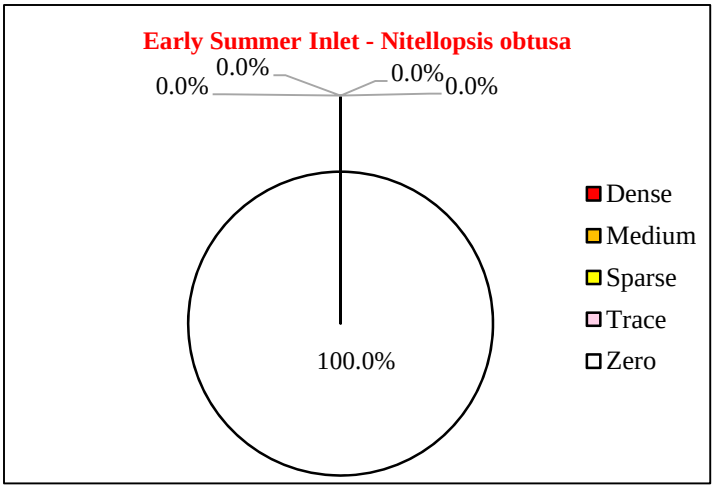


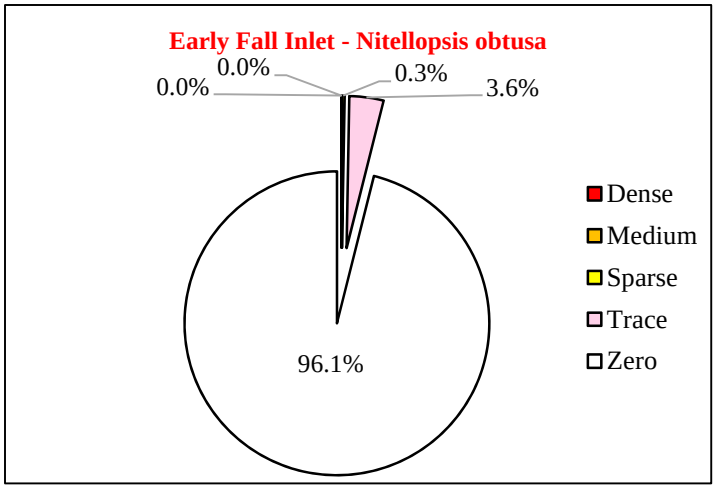


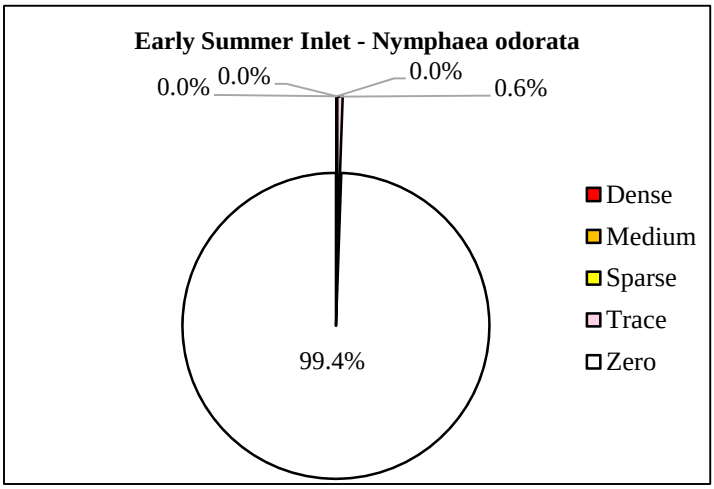


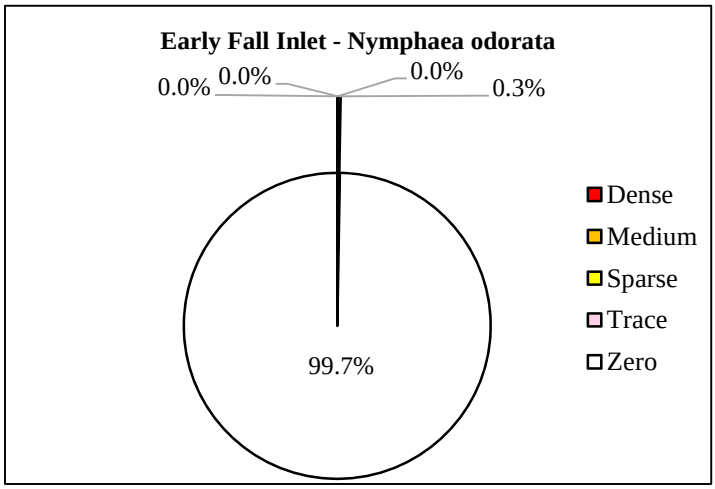


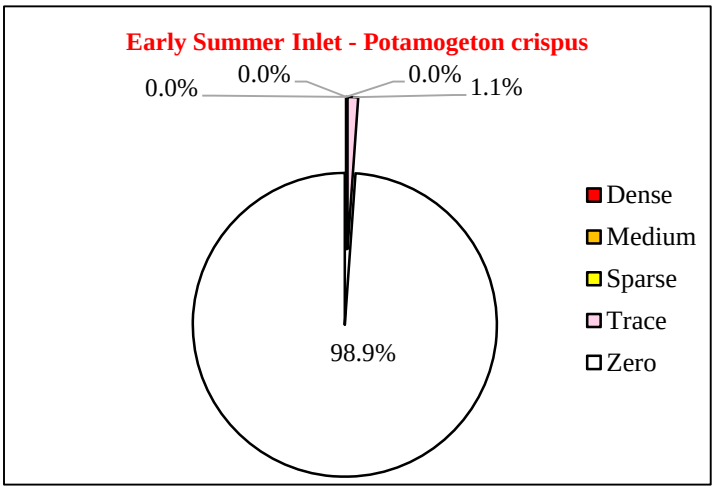
Inlet proper-Pie 4. Percentages of each abundance category of the total 358 rake-(early summer and early fall) made in the Inlet proper in 2017 to contrast the early summer with the early fall values for *Myriophyllum spicatum*, *Najas flexilis* and *Najas minor*.

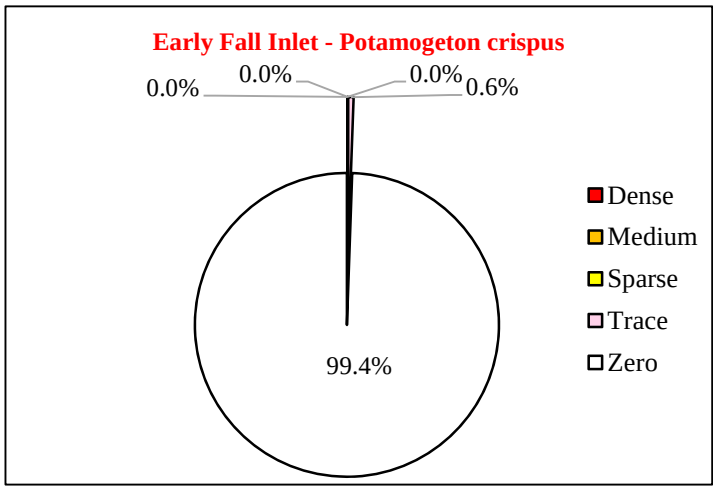




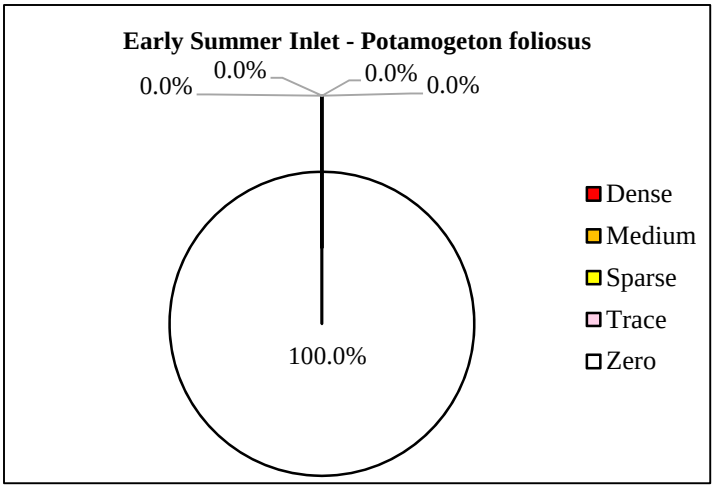


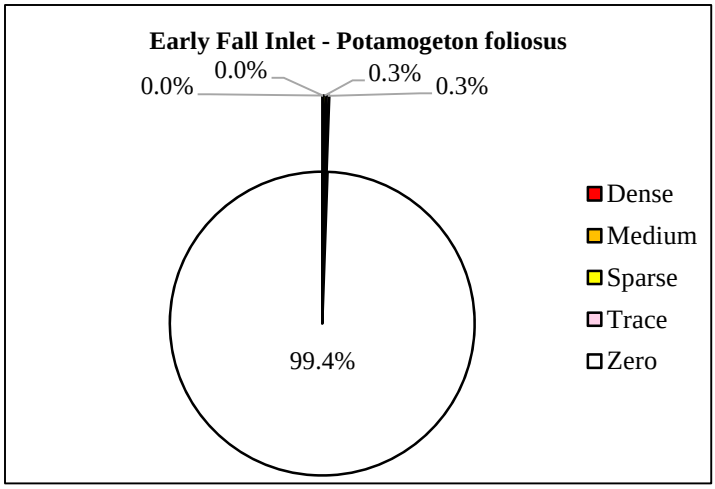


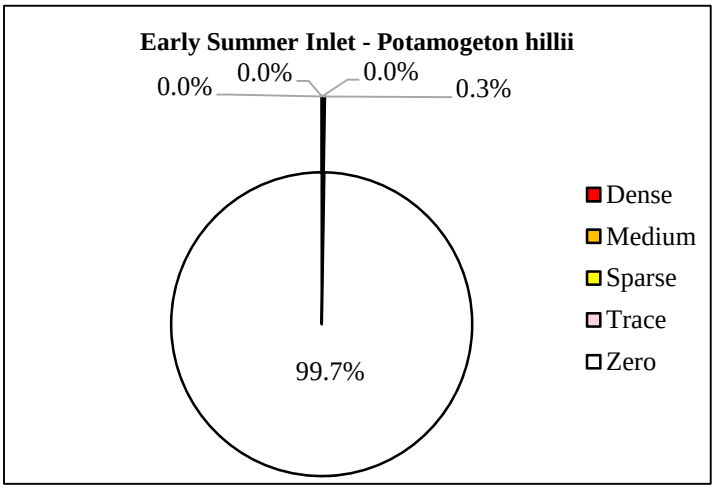


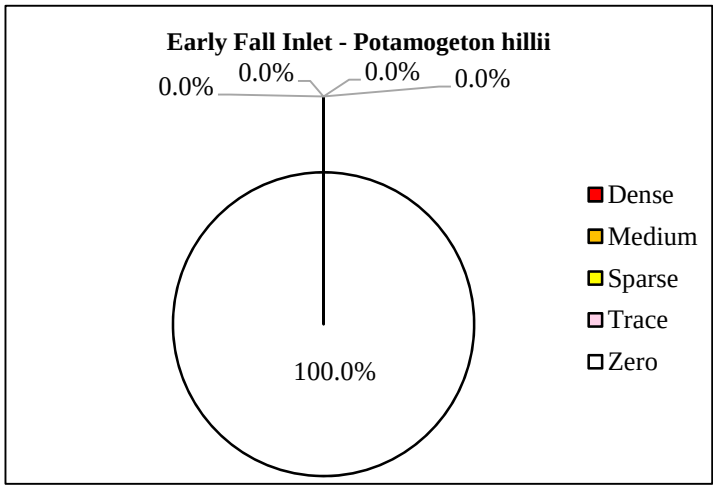


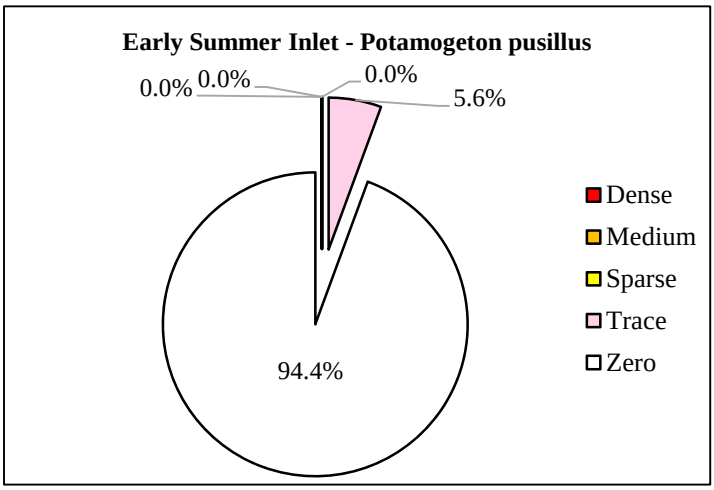
Inlet proper-Pie 5. Percentages of each abundance category of the total 358 rake-tosses (early summer and early fall) made in the Inlet proper in 2017 to contrast the early summer with the early fall values for *Nitellopsis obtusa*, *Nymphaea odorata*, *and Potamogeton crispus*.

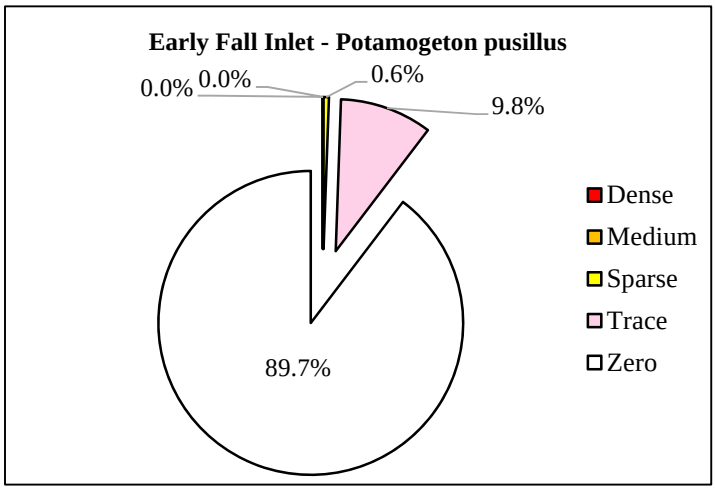




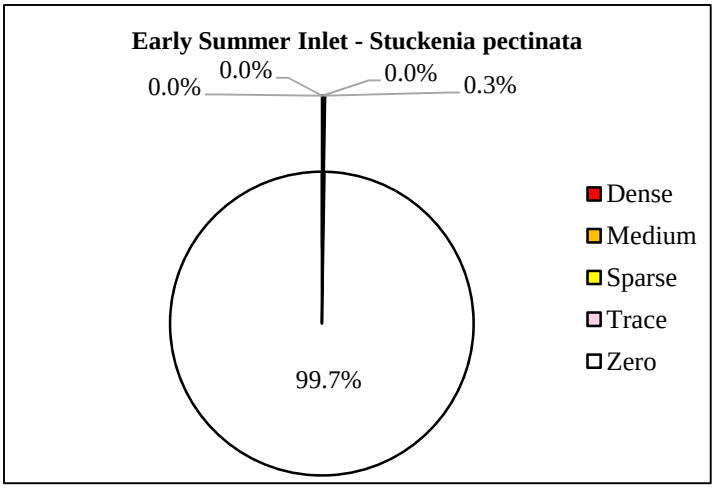


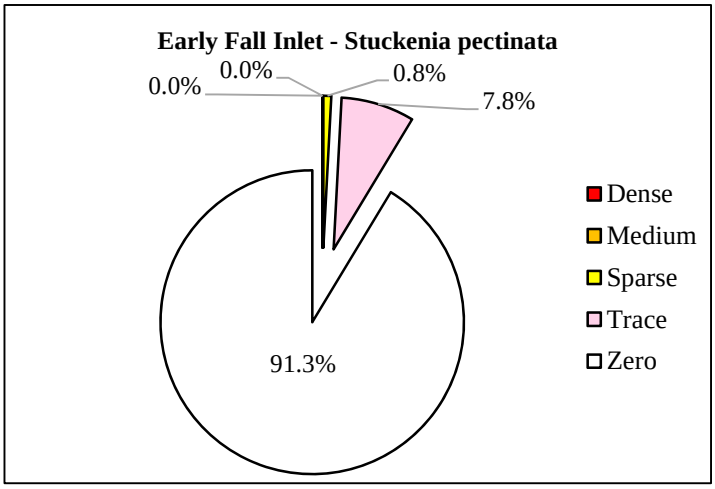


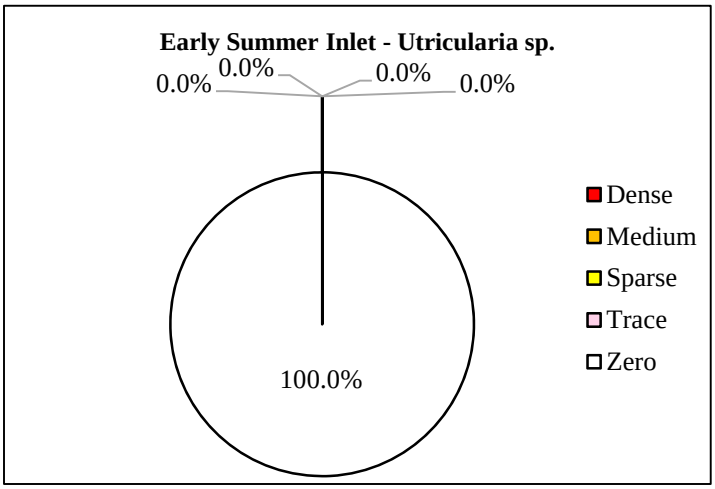


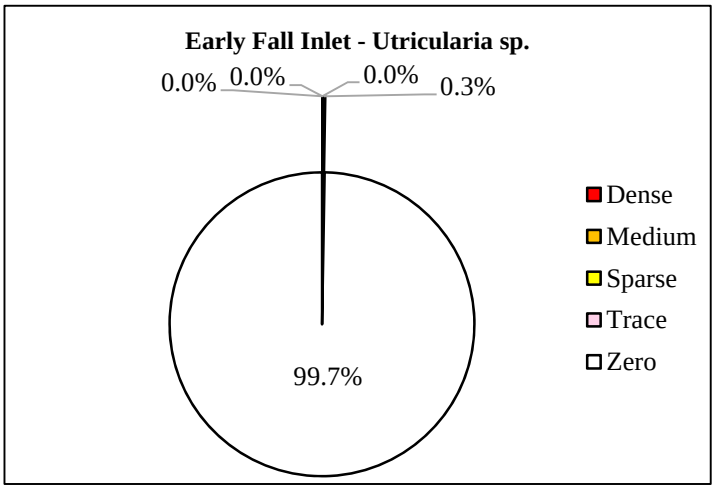


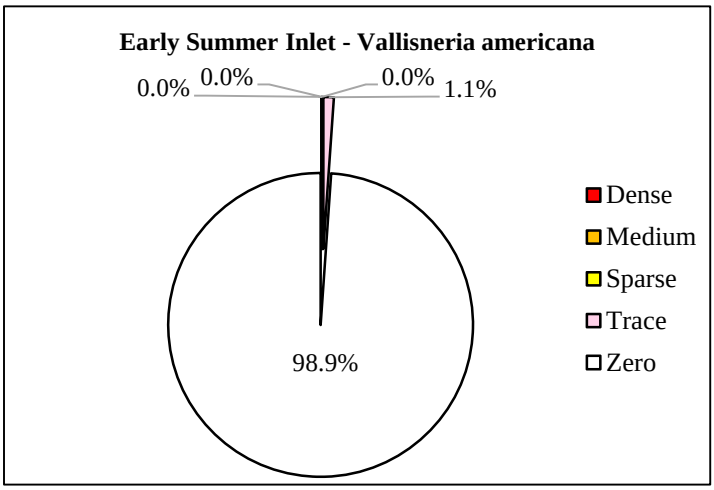
Inlet proper-Pie 6. Percentages of each abundance category of the total 358 rake tosses (early summer and early fall) made in the Inlet proper in 2017 to contrast the early summer with the early fall values for *Potamogeton foliosus*, *Potamogeton hillii* and *Potamogeton pusillus*.

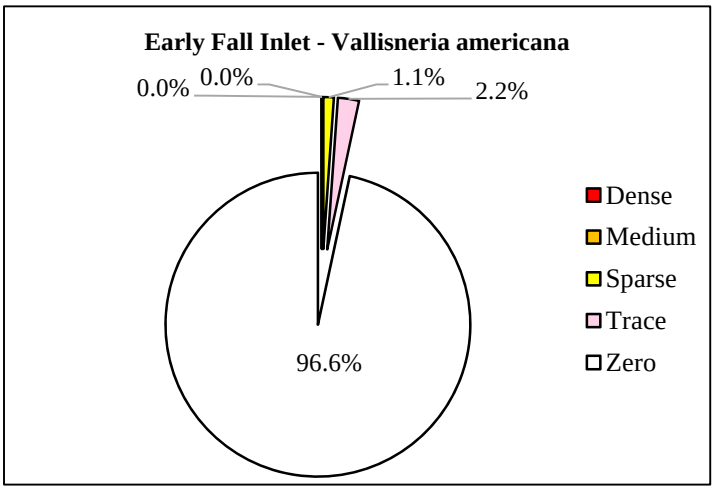




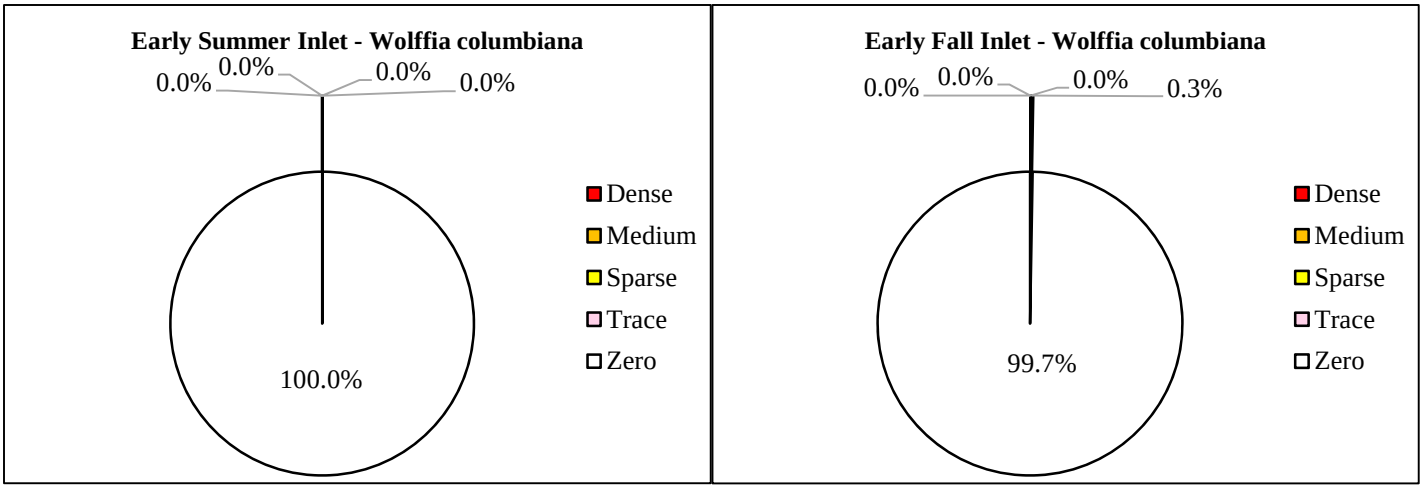


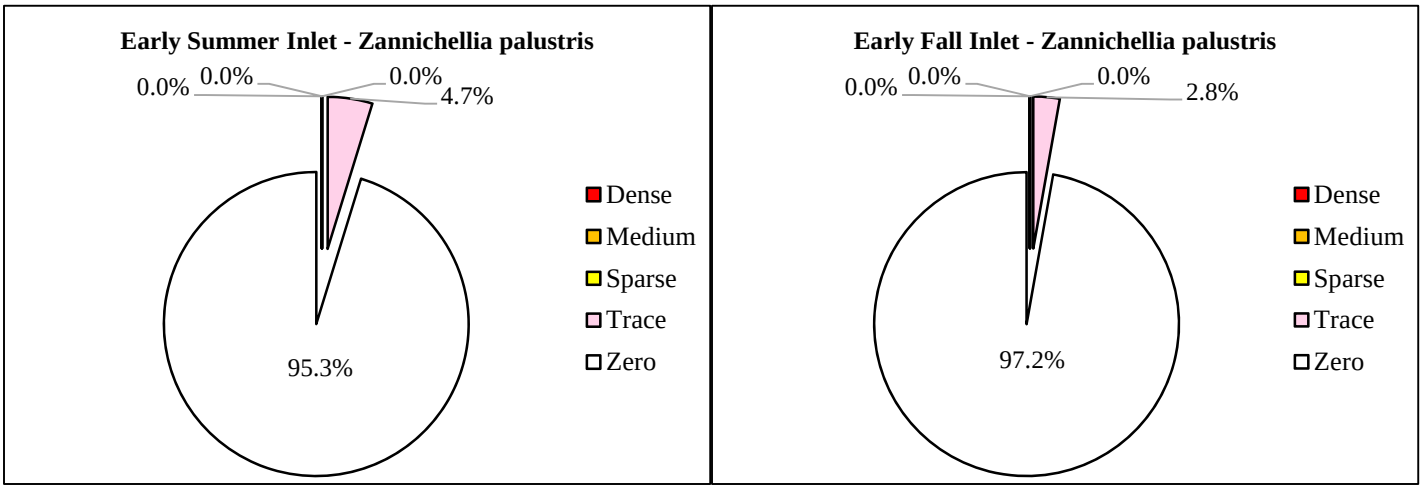




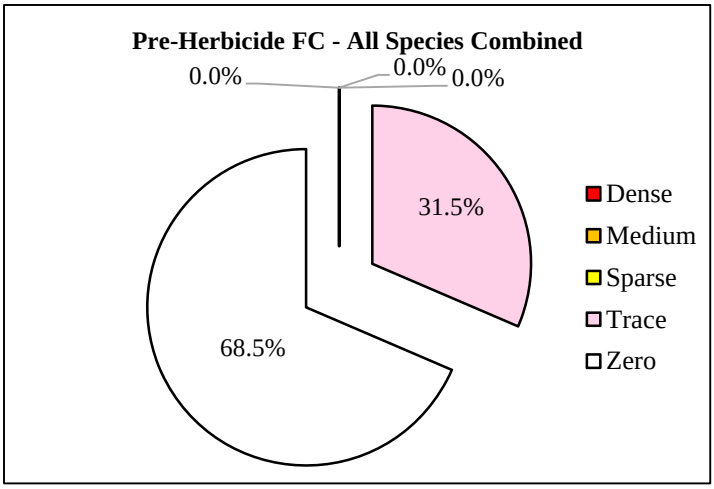


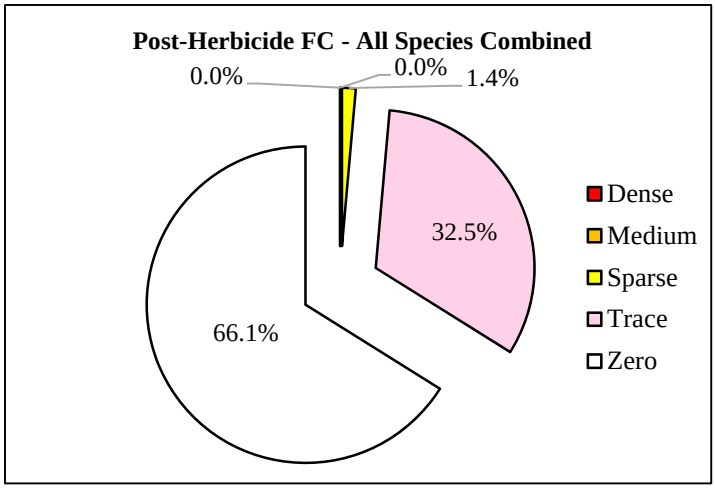
Inlet proper-Pie 7. Percentages of each abundance category of the total 358 rake tosses (early summer and early fall) made in the Inlet proper in 2017 to contrast the early summer with the early fall values for *Stuckenia pectinata*, *Utricularia sp.* and *Vallisneria americana*.

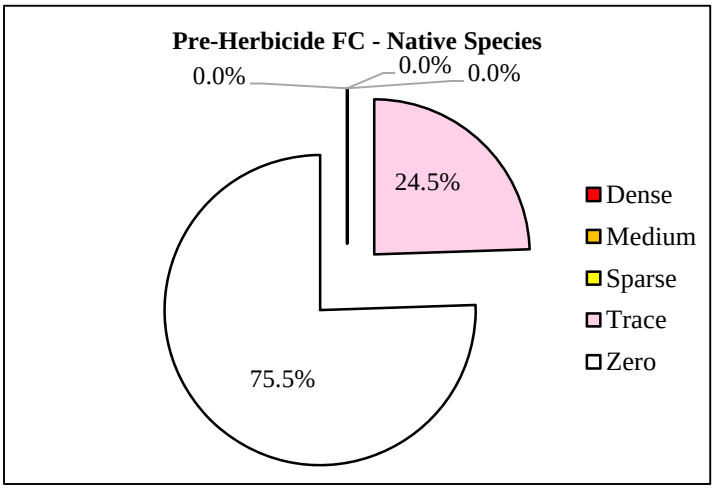


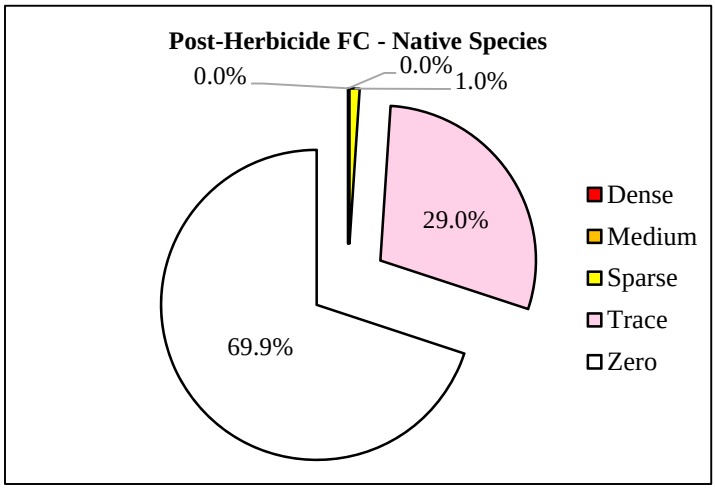


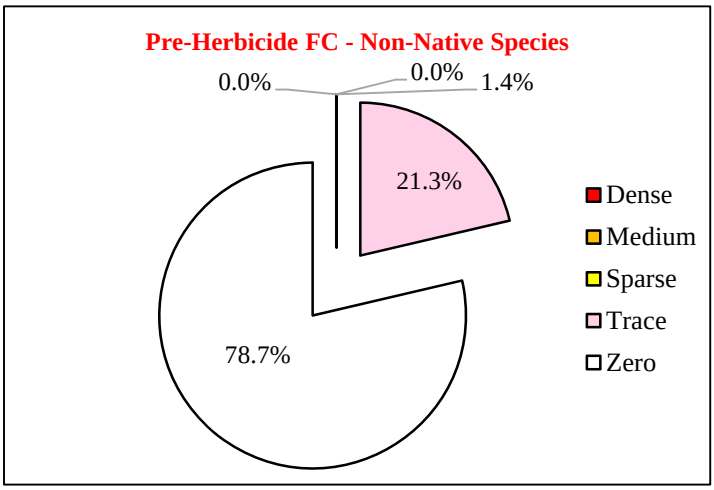
Inlet proper-Pie 8. Percentages of each abundance category of the total 358 rake-tosses (early summer and early fall) made in the Inlet proper in 2017 to contrast the early summer with the early fall values for *Wolffia columbiana* and *Zannichellia palustris.*

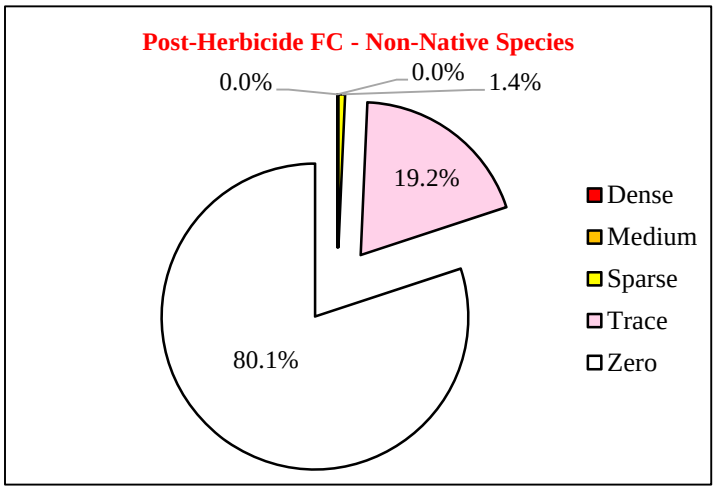




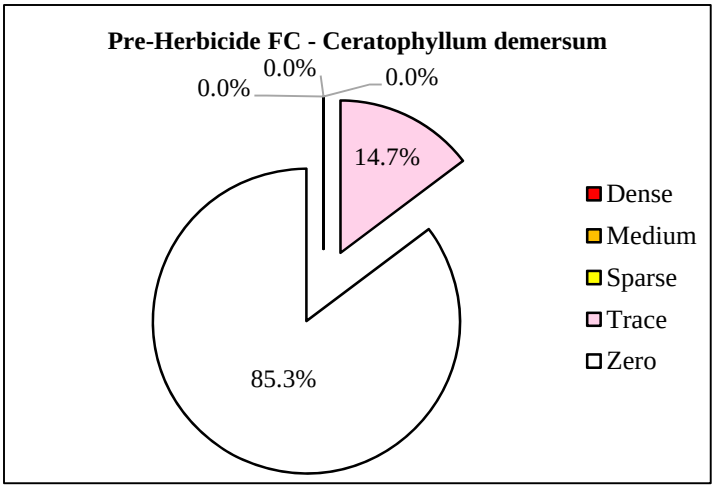


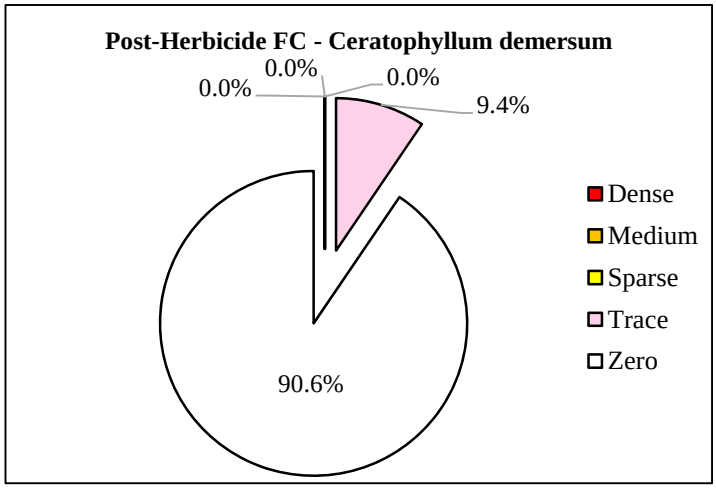


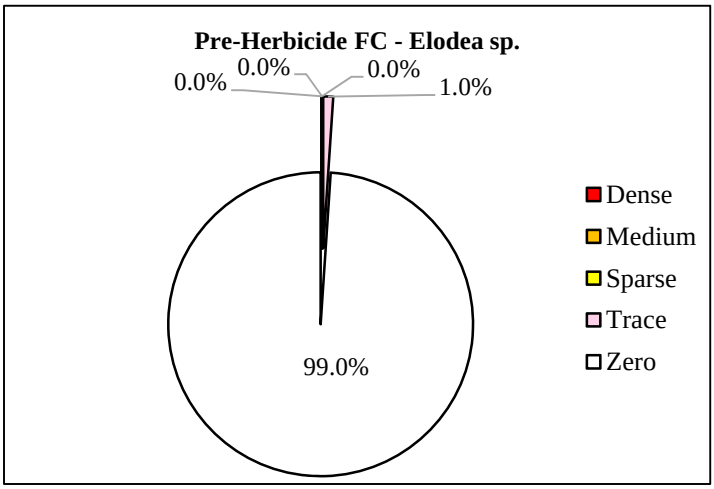


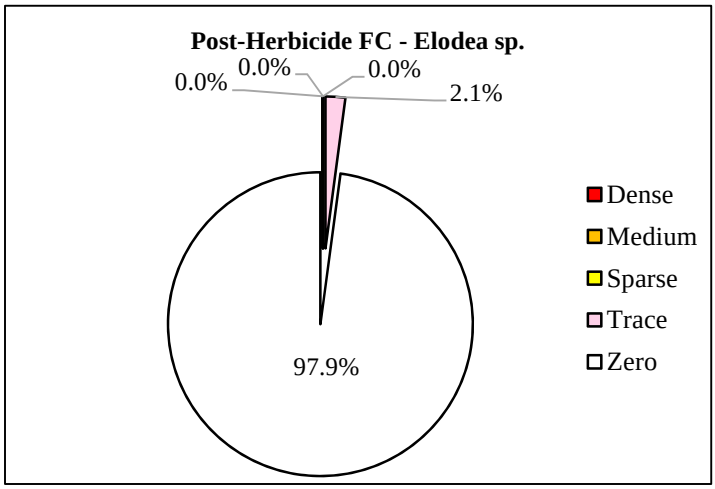


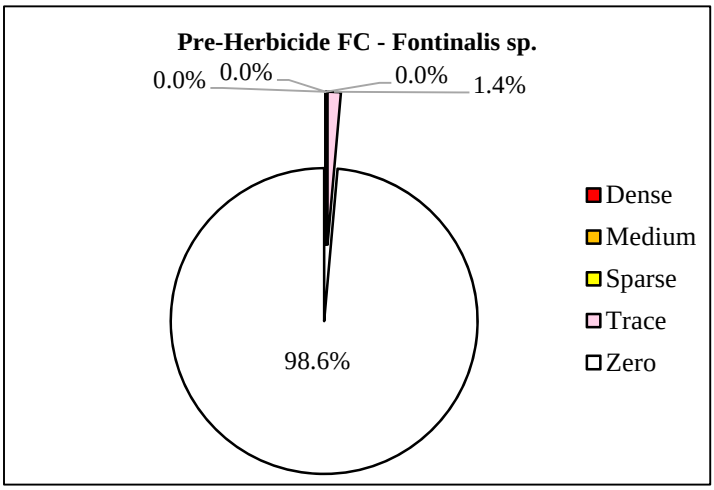
Fall Creek-Pie 1. Percentages of each abundance category of the total 286 rake-tosses (pre-herbicide and post-herbicide) made in the Fall Creek Area during 2017 to contrast the pre-herbicide and post-herbicide values for each species grouping for All species combined, Native species and Non-Native species.

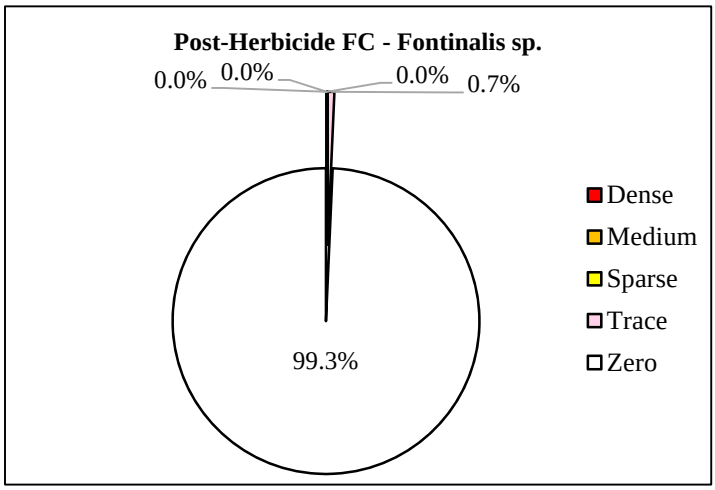




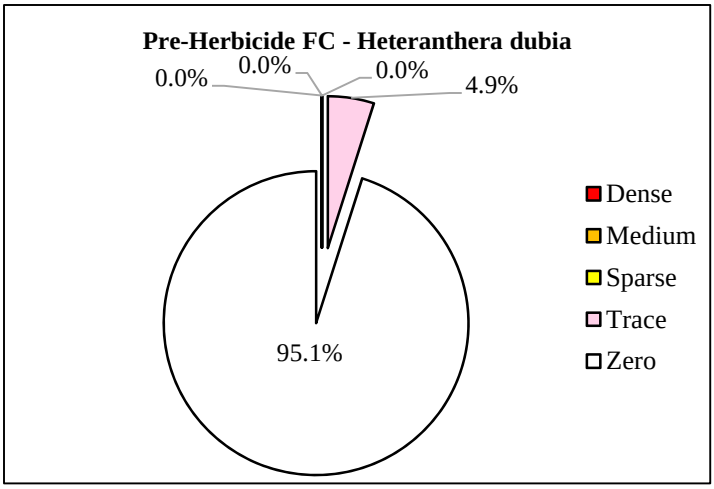


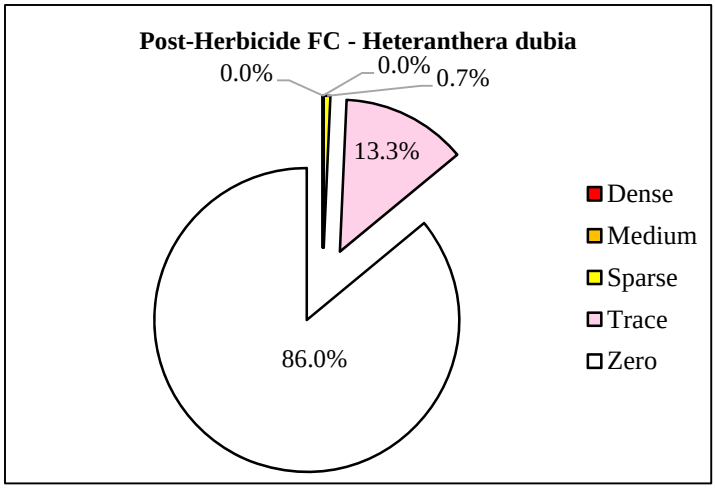


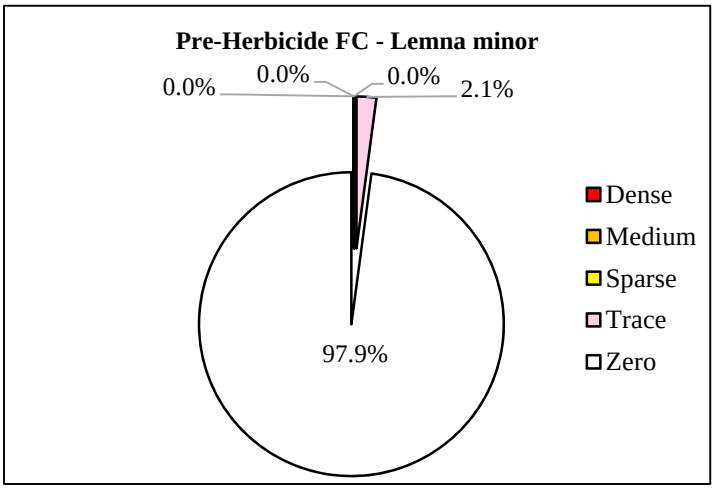


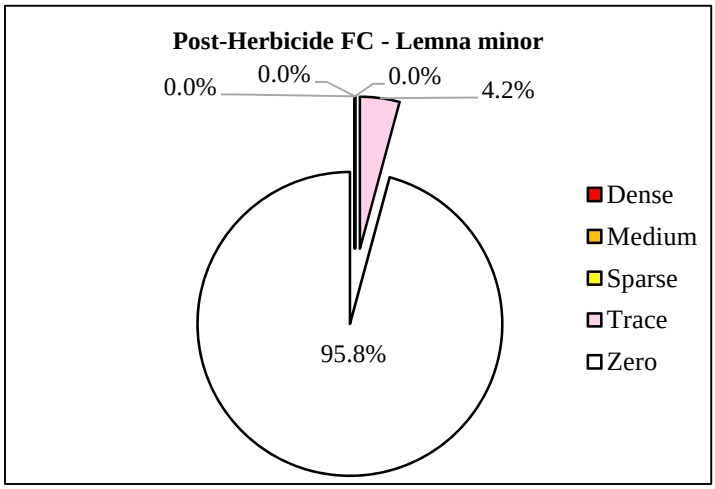


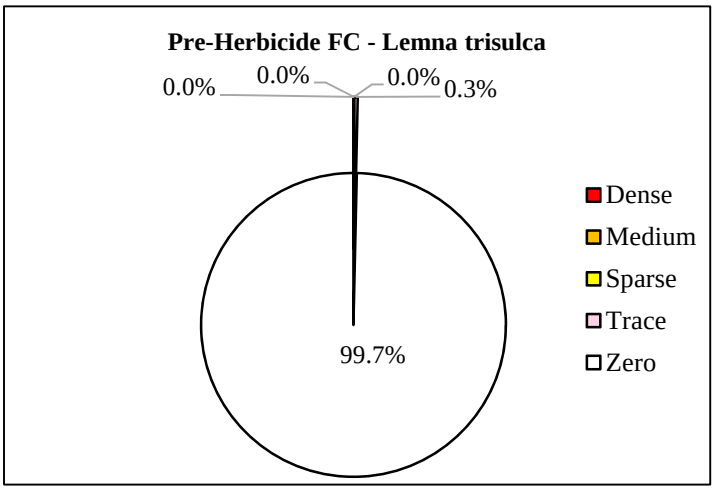
Fall Creek-Pie 2. Percentages of each abundance category of the total 286 rake-tosses (pre-herbicide and post-herbicide) made in the Fall Creek Area during 2017 to contrast the pre-herbicide and post-herbicide values for *Ceratophyllum demersum*, *Elodea sp.* and *Fontinalis sp.*

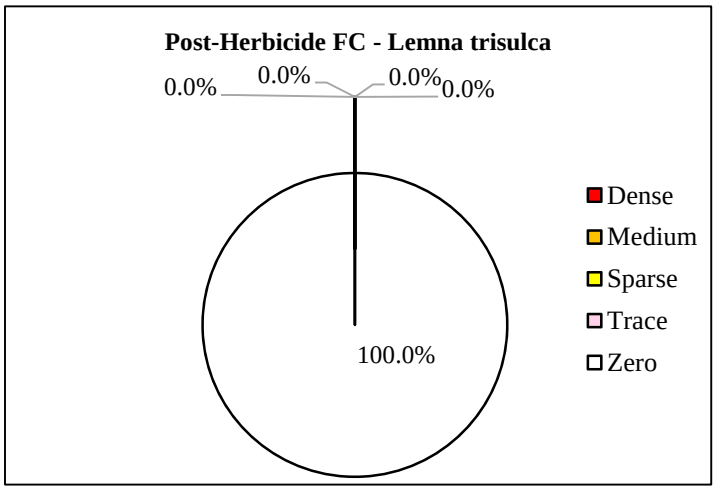




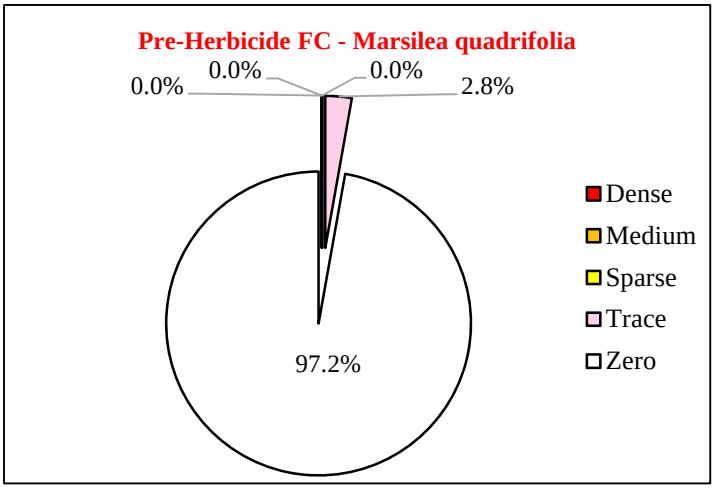


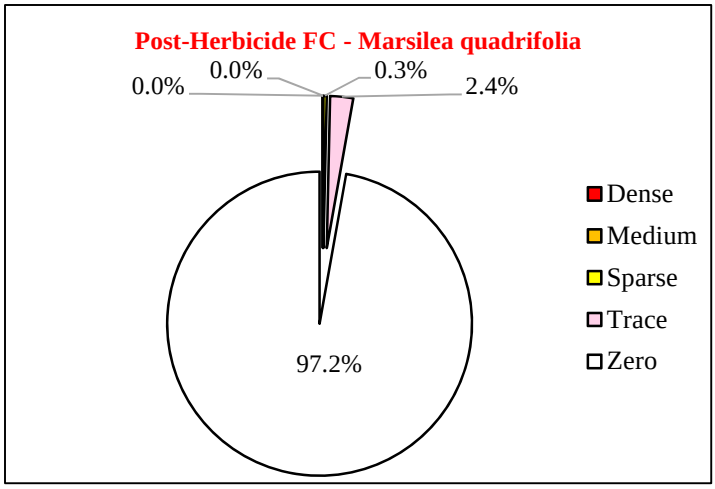


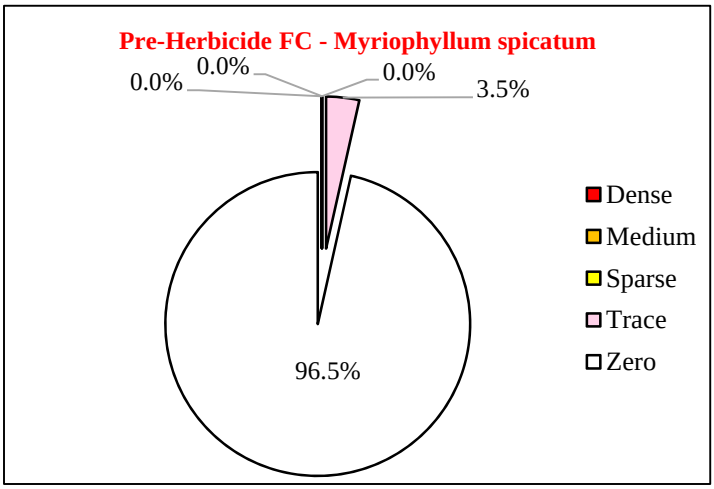


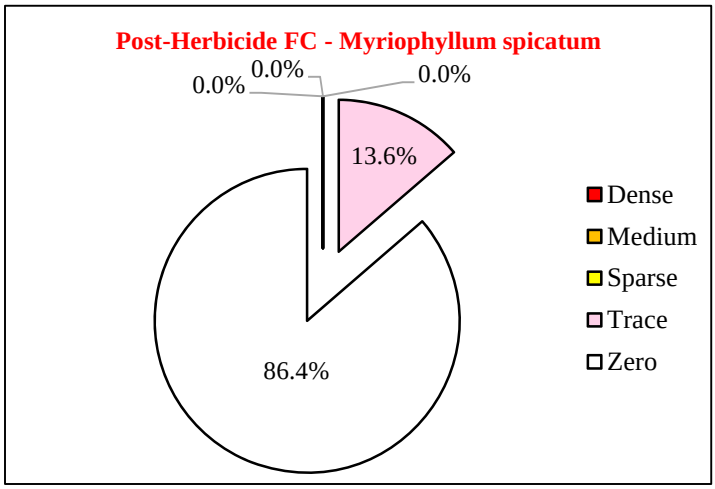


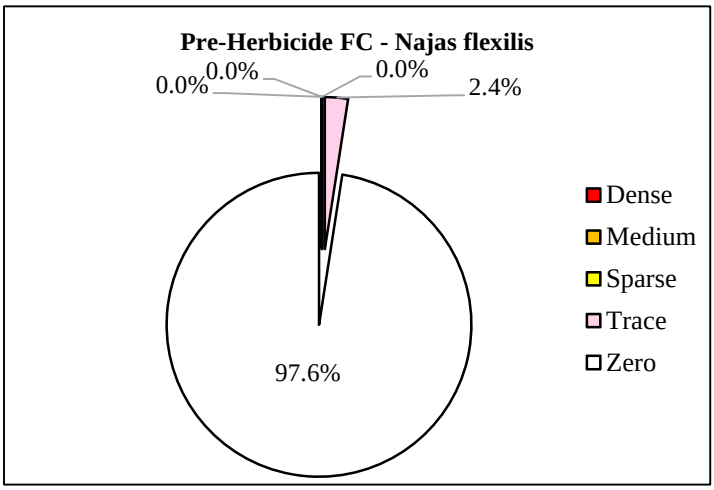
Fall Creek-Pie 3. Percentages of each abundance category of the total 286 rake-tosses (pre-herbicide and post-herbicide) made in the Fall Creek Area during 2017 to contrast the pre-herbicide and post-herbicide values for *Heteranthera dubia*, *Lemna minor* and *Lemna trisulca.*

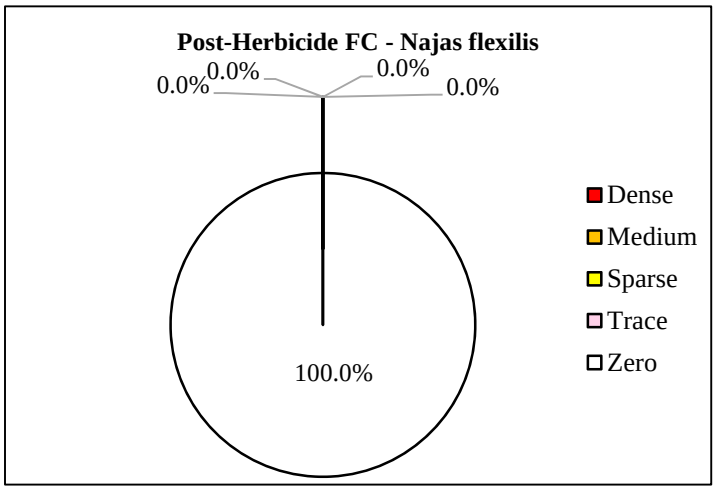




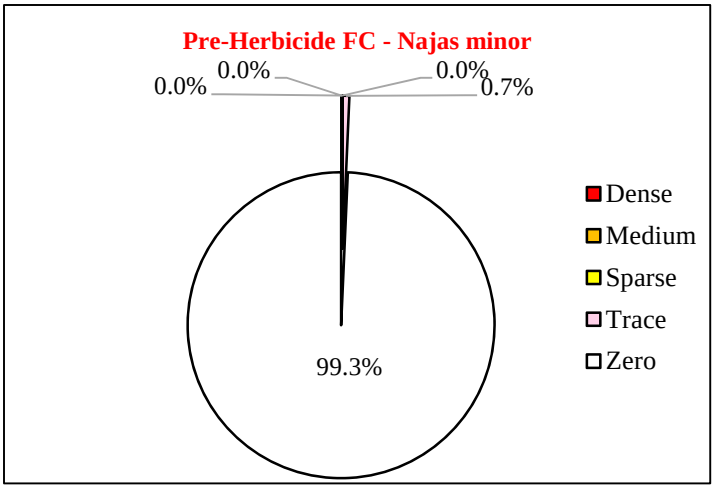


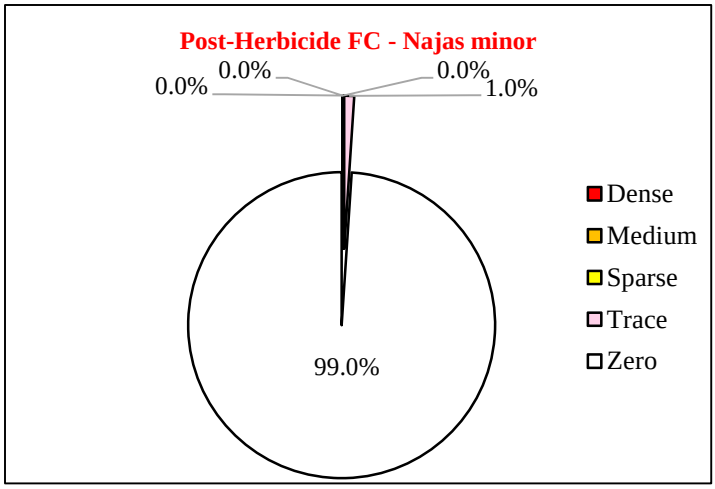


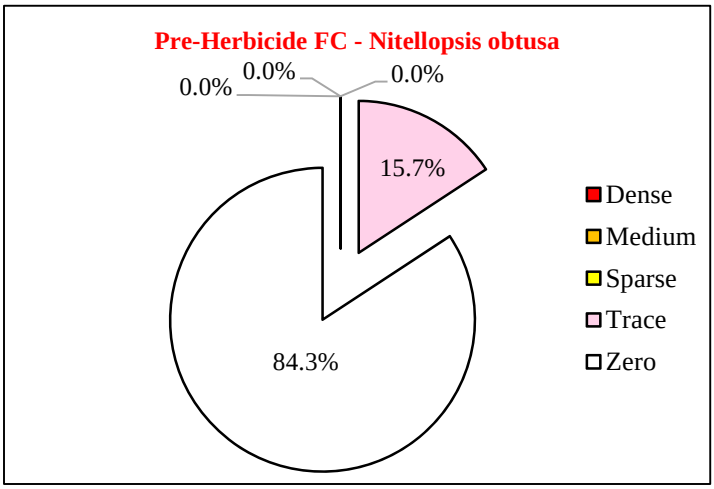


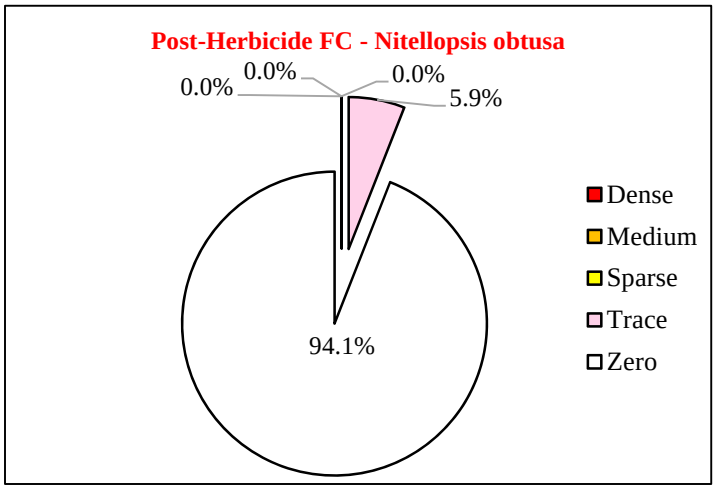


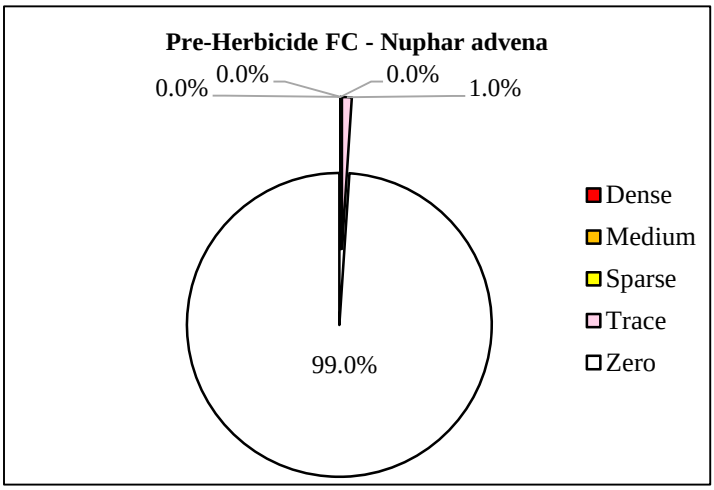
Fall Creek-Pie 4. Percentages of each abundance category of the total 286 rake-tosses (pre-herbicide and post-herbicide) made in the Fall Creek Area during 2017 to contrast the pre-herbicide and post-herbicide values for *Marsilea quadrifolia*, *Myriophyllum spicatum* and *Najas flexilis*.

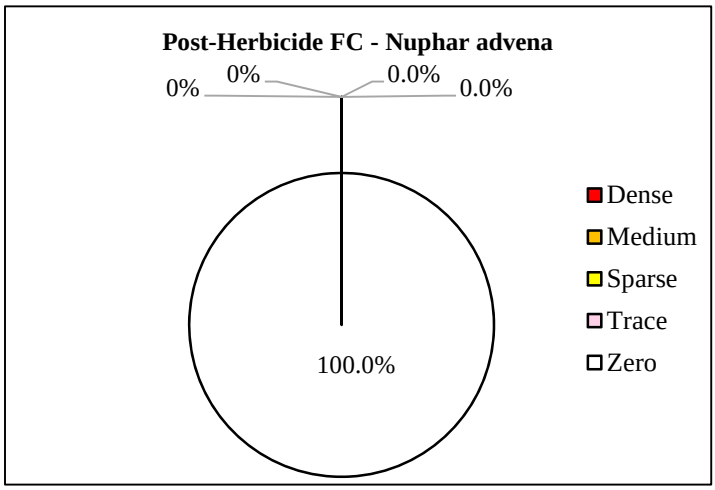




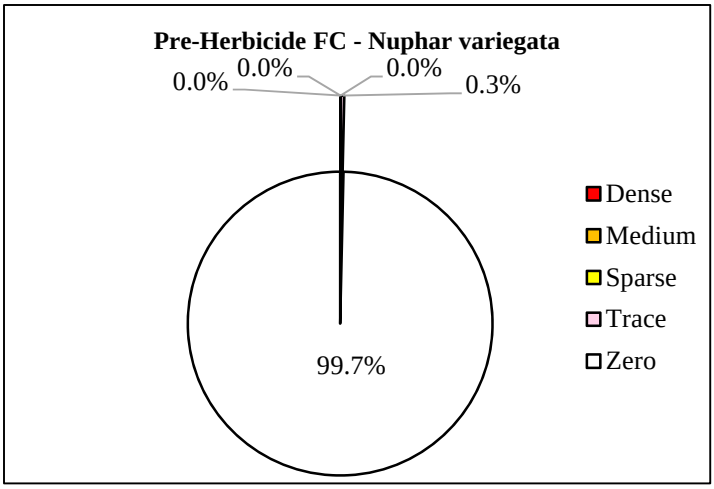


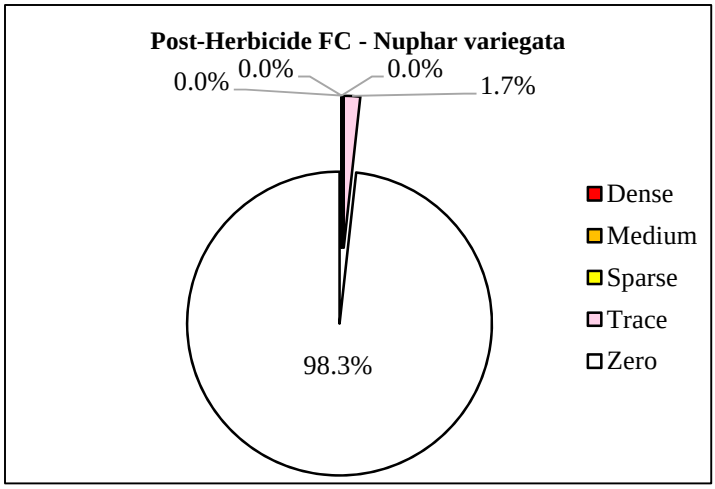


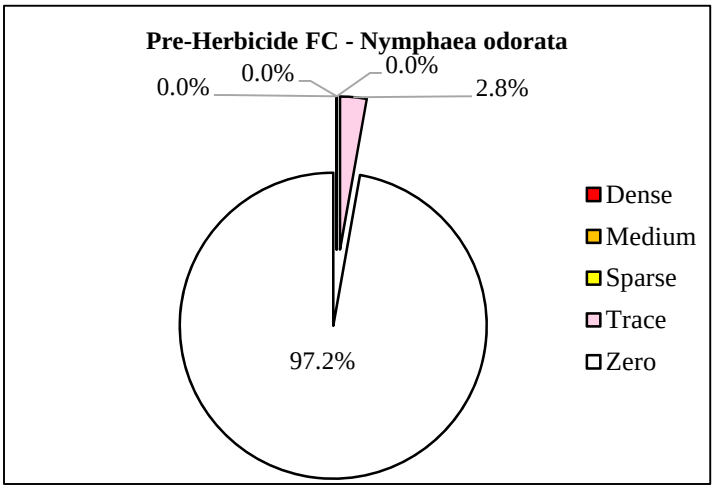


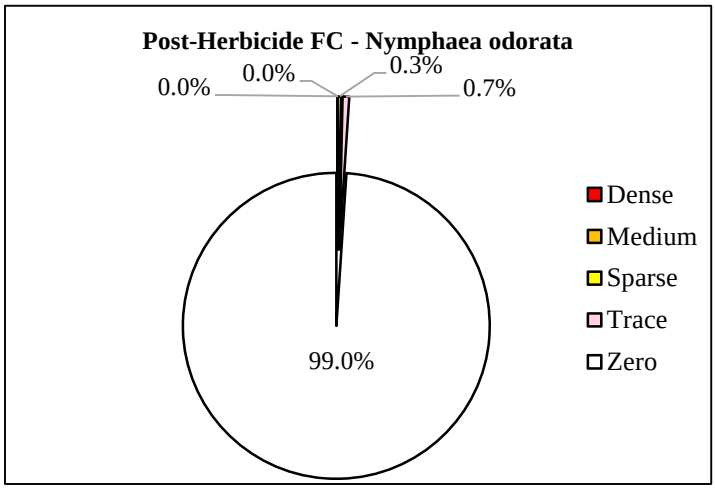


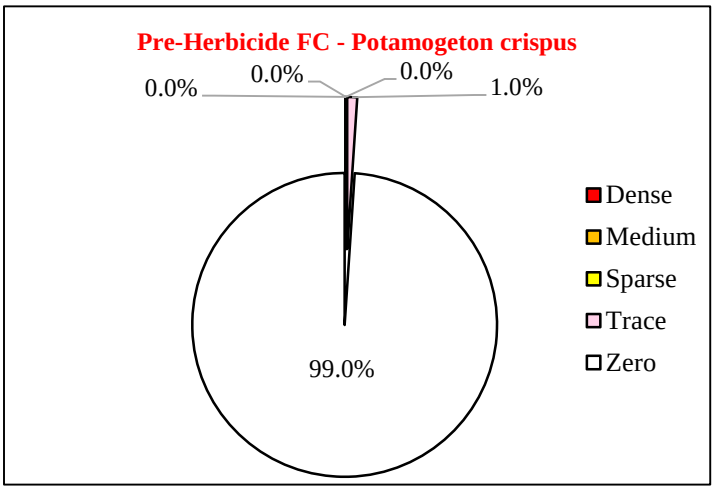
Fall Creek-Pie 5. Percentages of each abundance category of the total 286 rake-tosses (pre-herbicide and post-herbicide) made in the Fall Creek Area during 2017 to contrast the pre-herbicide and post-herbicide values for, *Najas minor*, *Nitellopsis obtusa* and *Nuphar advena*.

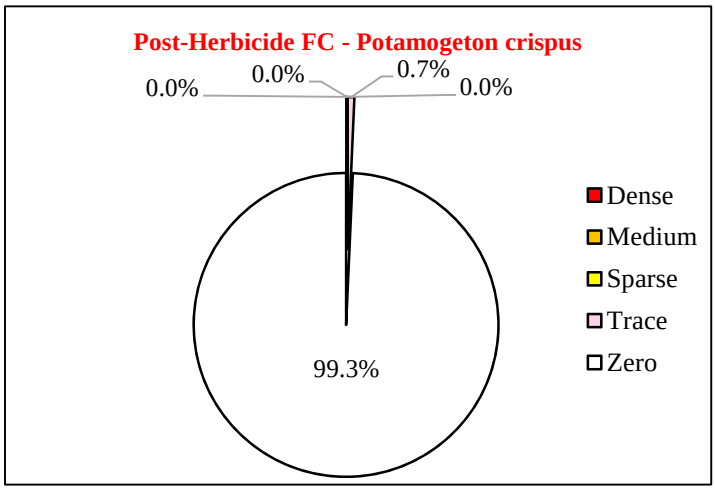




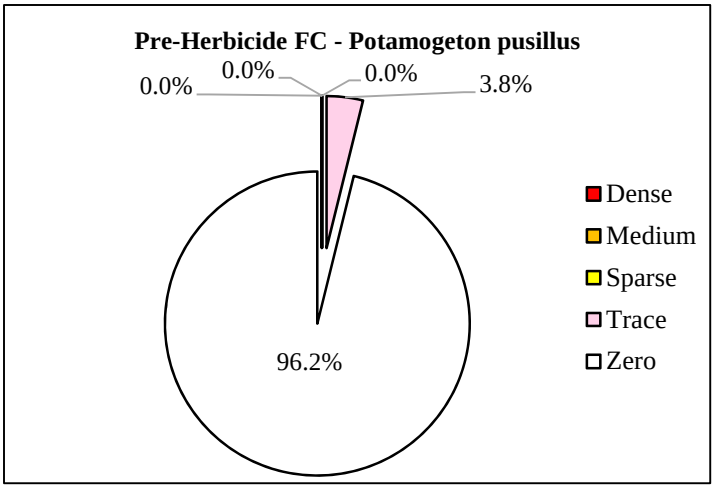


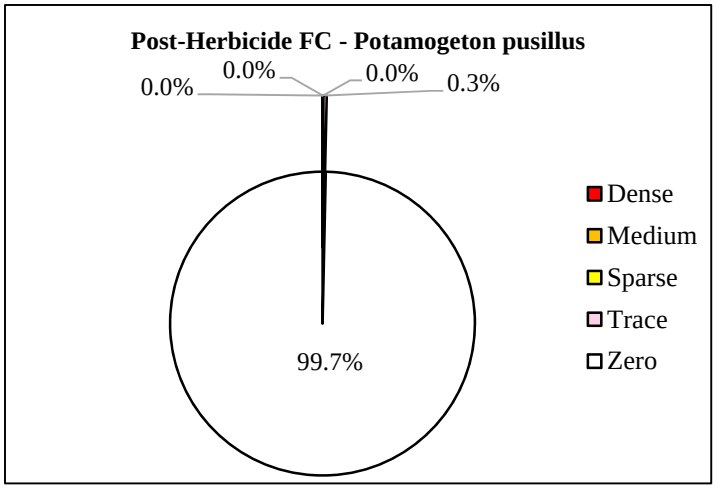


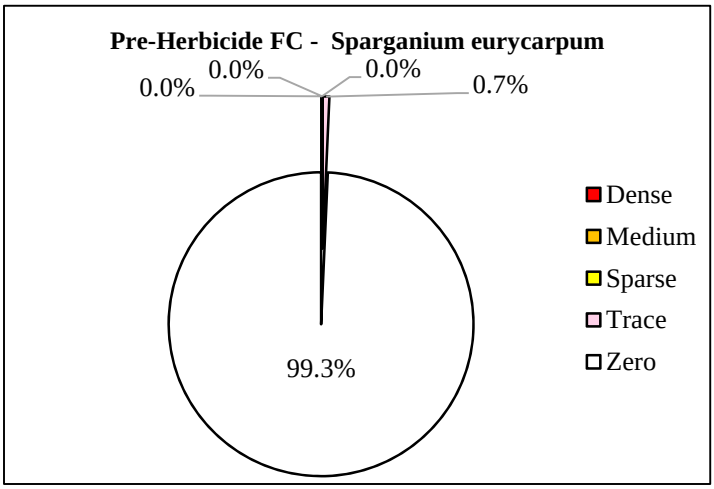


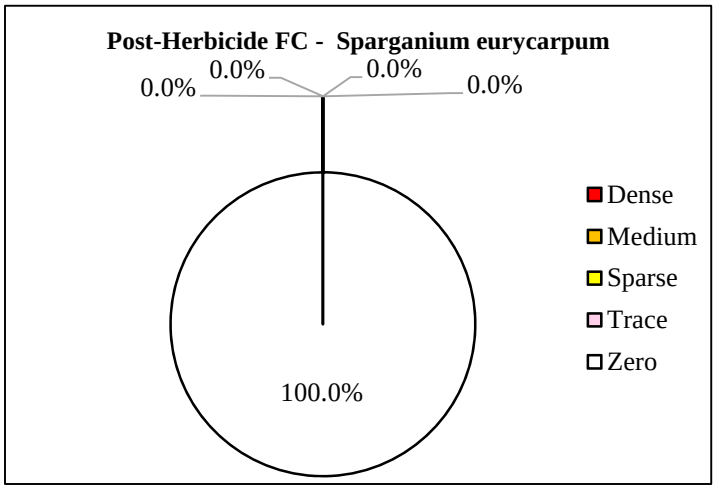


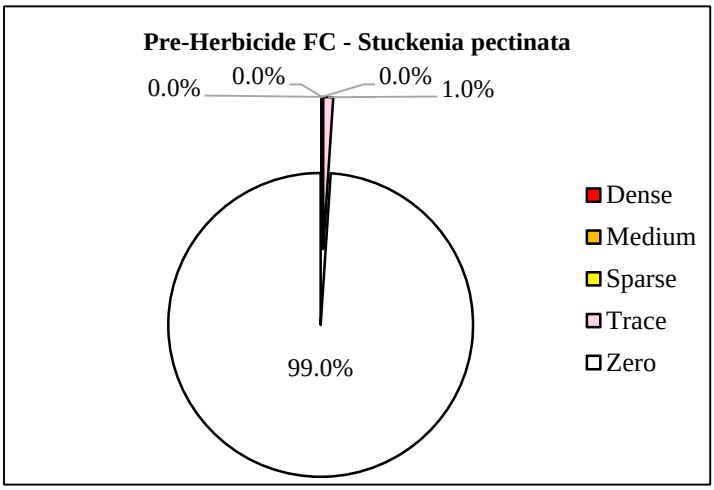
Fall Creek-Pie 6. Percentages of each abundance category of the total 286 rake-tosses (pre-herbicide and post-herbicide) made in the Fall Creek Area during 2016 to contrast the pre-herbicide and post-herbicide values for *Nuphar variegata*, *Nymphaea odorata* and *Potamogeton crispus*.

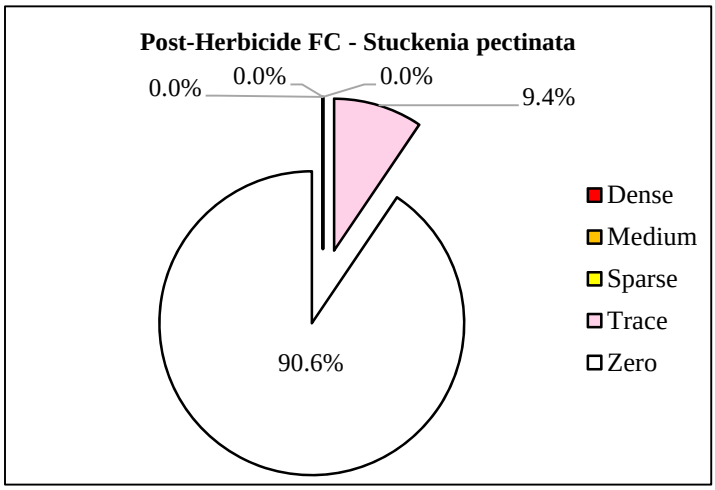




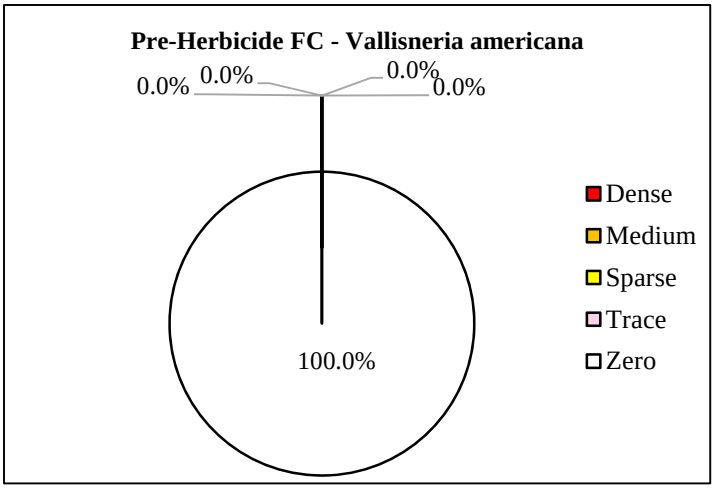


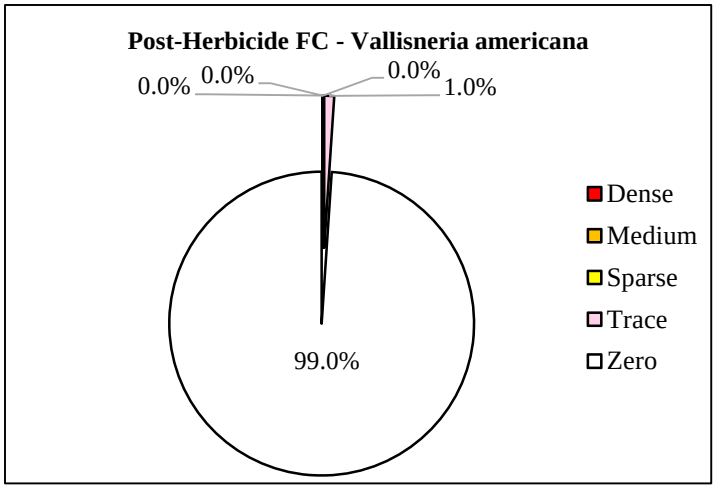


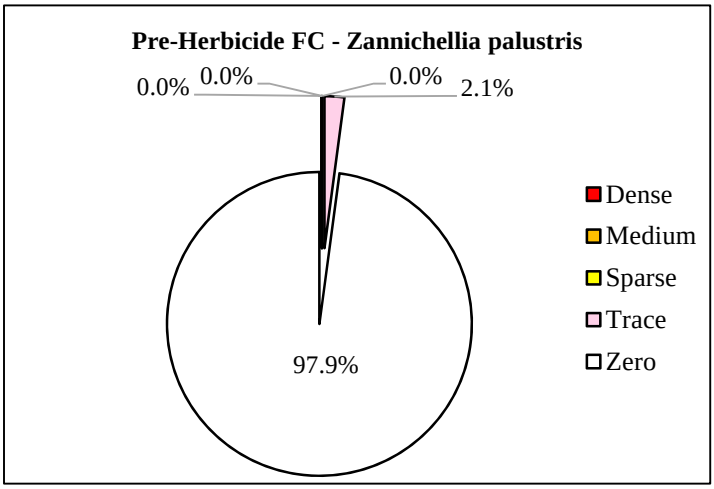


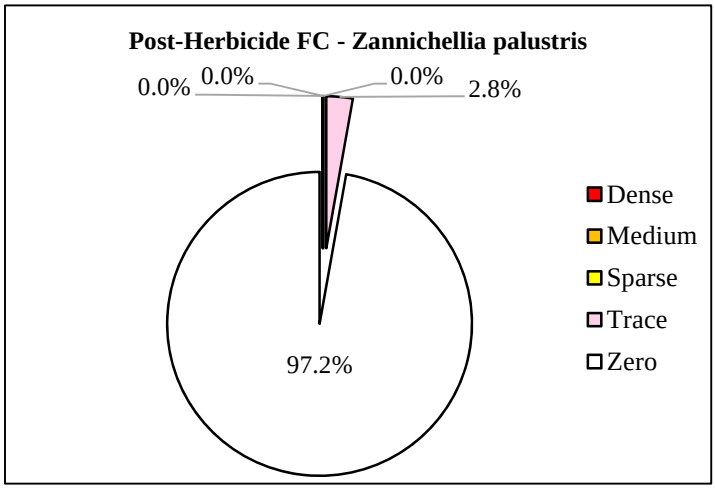


Fall Creek-Pie 7. Percentages of each abundance category of the total 286 rake-tosses (pre-herbicide and post-herbicide) made in the Fall Creek Area during 2016 to contrast the pre-herbicide and post-herbicide values for *Potamogeton pusillus*, *Sparganium eurycarpum* and *Stuckenia pectinata*.









Fall Creek-Pie 8. Percentages of each abundance category of the total 286 rake-tosses (pre-herbicide and post-herbicide) made in the Fall Creek Area during 2017 to contrast the pre-herbicide and post-herbicide values for *Vallisneria americana* and *Zannichellia palustris*.

Appendix

Data 1. Cayuga Lake rake-toss measurements recorded in 2017. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss……..…155

Data 2. Lighthouse rake-toss early summer measurements recorded in 2017. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss…….246

Data 3. Lighthouse rake-toss early fall measurements recorded in 2017. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss…….248

Data 4. Inlet proper rake-toss early summer measurements recorded in 2017. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss…….250

Data 5. Inlet proper rake-toss early fall measurements recorded in 2017. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss…….262

Data 6. Fall Creek rake-toss pre-herbicide measurements recorded in 2017. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss…….274

Data 7. Fall Creek rake-toss post-herbicide measurements recorded in 2017. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss…….283

Coordinates 1. Dates and locations of hydrilla discoveries in southern Cayuga Lake during 2017, using true north and North American Datum 1983.....292

Data 1. Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 1. (Continued) Cayuga Lake rake-toss measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 3. Lighthouse rake-toss early fall measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T= trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 4. (Continued) Inlet proper rake-toss early summer measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 4. (Continued) Inlet proper rake-toss early summer measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 5. Inlet proper rake-toss early fall measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 5. (Continued) Inlet proper rake-toss early fall measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 6. (Continued) Fall Creek rake-toss pre-herbicide measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 6. (Continued) Fall Creek rake-toss pre-herbicide measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 7. (Continued) Fall Creek rake-toss post-herbicide measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.

Data 7. (Continued) Fall Creek rake-toss post-herbicide measurements recorded in 2017. We recorded each rake-toss as either D = dense; M = medium; S = sparse; T = trace; or O = zero as an abundance rating. The values for each plant species in each row is the biologist's percentage estimate as part of the whole rake-toss.
